INTRODUCTION

The Alaska Maritime National Wildlife Refuge (AMNWR) comprises 3.4 million acres of islands and coastline across the Gulf of Alaska and Bering and Chukchi seas and provides breeding habitat for more than 40 million seabirds. A major objective of the refuge is to collect baseline status and trend information for a suite of seabird species; these data include timing of breeding, reproductive performance, chick growth, population trends, survival, and diet. By relating these parameters to environmental conditions, ecosystem processes may be better understood.

Seabird diet in particular may be a valuable indicator of marine conditions, as seabirds have high energy requirements that make them especially sensitive to changes in the environment that affect prey availability and abundance (Piatt et al. 2007). With seabird diet data from many years across a broad geographic region, we can examine changes in the lower trophic levels of the marine ecosystem and explore how those changes may have consequences for populations of seabirds and other organisms.

We present a brief summary of diet data from birds (mostly seabirds, with some limited data from shorebirds and waterfowl) collected at AMNWR sites from 1975-2015, comprising summary figures from a more detailed diet summary of all refuge data (Drummond 2016). This represents the refuge's most current diet dataset to date (excluding some raptor diet historically collected on the refuge); however, diet collection is still ongoing, primarily at annual monitoring sites, and additional diet data will exist in future years.

METHODS

i. Diet sample collection

Diet samples were collected from birds at numerous AMNWR sites from 1975 to 2015 (diet collection is still ongoing, primarily at annual monitoring sites, and additional diet data will exist in future years). Samples were collected by a mix of refuge staff and research partners, both as part of the refuge's annual monitoring program and as specific short-term research projects. Collection techniques varied greatly across different species (Table 1) and over time; sampling in earlier years consisted primarily of shooting birds while more recent years emphasized non-lethal sampling methods (e.g., collecting regurgitations).

ii. Prey identification

Samples were either identified immediately in the field or preserved (ethanol, isoproponol, formalin, Strek Tissue Fixative, or frozen) and sent to a laboratory for later analysis. Prey in samples was identified to the lowest taxonomic level possible (often to species but sometimes only to genus, family, order, etc.; for a complete list of all prey items ever found, see Appendices A-E). Identification follows the Integrated Taxonomic Information System (ITIS) when possible. During identification, lab analysts recorded some or all of the following data when possible:

- (a) mass of entire sample
- (b) counts of prey items (rarely, no count was made and only "presence" recorded)
- (c) mass, various length measurements, sex, and life stage of individual prey items
- (d) length measurements of individual otoliths and squid beaks
- (e) percent total mass, percent total volume, and displacement volume of prey items in sample
- (f) indices of condition of prey items and relative amount of digestion

Some samples were identified in their entirety (every prey item in the sample identified), and some were sub-sampled to various levels with final prey numbers then calculated by the appropriate correction factor.

Because samples were collected across such a long time period and from so many different seabird species, the diet dataset has some unavoidable biases. Firstly, detection of different types of prey probably varied by how the sample was collected. For example, stomach samples consist mainly of hard parts (otoliths and squid beaks) left after digestion and probably vastly underestimate presence of soft-bodied zooplankton compared to relatively-undigested regurgitation and bill load samples. Secondly, the ability of analysts to identify prey items to the lowest taxonomic level varied both with skill level of different analysts and the condition of the sample (in some years, samples were identified soon after collection, whereas in other years there was a 5-10 year wait for samples to be identified).

iii. Diet data summary

We quantified diet data in four different ways. For all species we calculated both frequency of occurrence and percent composition of prey items. Frequency of occurrence is the percentage of samples each year in which each prey item is present, based simply on presence or absence. Total values of frequency occurrence of all prey items often sums to more than 100% in a given year because multiple prey types can be present in a single sample. In contrast, percent composition is based on the counts of prey items and is calculated as the percentage of the total number individual prey items comprised by each prey item each year (sums to 100% each year).

For puffin and rhinoceros auklet chick diet, which consists of whole, undigested fish, we calculated a third diet index using mass of prey items. Relative biomass is the percentage of the mass of the sample comprised by each prey item (sums to 100% each year). Biomass values for samples with partially or entirely digested prey (e.g., stomach samples or kittiwake and storm-petrel regurgitations) and primarily zooplankton (e.g., auklets) are more difficult to calculate because in most cases we do not have mass data for each individual prey item. It is possible to reconstruct an index of biomass using a mass standard for each prey species and we hope to do this in the future.

For gull pellets, we calculated an additional diet index based on the relative volume of made up by each prey item in a pellet. Percent volume is the average percent composition by volume of a prey item in all pellets (sums to 100% each year).

All AMNWR refuge diet data are housed in and summarized by an Access database. Some values may differ from historic presentations in reports, presumably due to corrections in previous calculations.

iv. Presentation

This report is a briefer summary of diet data extracted from a more detailed diet summary of refuge data (Drummond 2016). Data in figures are grouped at higher taxonomic levels to allow generalized summary across sites and years (groupings were chosen to highlight major diet items of each species). For detailed tables showing diet identified to the lowest taxonomic level possible, see the full report (Drummond 2016).

Due to the sheer enormity of these diet datasets (over 62,000 samples from 69 sites and 32 species), for this report we had to limit the scope of our presentation. We chose to only present figures and tables for those species and sites with at least 5 years of data or ongoing diet sampling. For a complete list of all refuge diet datasets that exist, including those that were not summarized here due to space constraints, see Tables 2-3 (these additional diet datasets can be obtained by contacting AMNWR biologists).

For most species, we separated adult and chick diet, as there is evidence that many seabird species feed chicks different prey than they eat themselves (e.g., Hunt et al. 1996, Pedrocchi et al. 1996, Daveron and Burger 1999, Fijn et al. 2012). For kittiwakes, however, it was often not possible to distinguish between chick and adult diet, given the recipient was not always recorded, adults store prey in their crops for several hours before regurgitating it to the young, and some sampling methods collected both stomach and regurgitation samples. Therefore, for black-legged and red-legged kittiwakes, we

lumped adult and chick diet together. This is consistent with previous publications on kittiwake diet (e.g., Decker et al., 1995; Hunt et al., 1996a; Sinclair et al., 2008, Renner et al. 2012), and indeed a study on black-legged kittiwakes in the Barents Sea found diets between adults and chicks did not differ significantly (Thorvaldsen et al. 2015).

This report is organized by seabird species in taxonomic order per the American Ornithologist Union (AOU), and within each species by geographic area from southeast Alaska west through the Alaska Peninsula and the Aleutian Islands, and then north through the Bering and Chukchi seas. In some figures and summary tables, different geographic units in the AMNWR are identified by colors.

v. Study sites

Diet data summarized in this report come from 20 sites across the AMNWR (Figure 1). These include all AMNWR annual monitoring sites (current: St. Lazaria, Barren Islands/East Amatuli, Chowiet, Aiktak, Buldir, St. George, St. Paul islands and Cape Lisburne; historic: Cape Thompson and Kasatochi Island), as well as some sites visited on an intermittent or opportunistic basis (Gull, Chisik, Suklik, Midun, Puffin, Egg, Bogoslof, Kiska, and St. Matthew islands). The Bluff site is not currently refuge land but is included here because the site is of biological importance and data were collected by refuge staff under a historic agreement between the refuge and landowners.

ACKNOWLEDGMENTS

None of these data would exist without the countless individuals who spent time collecting and analyzing these samples.

Table 1. Types of diet data presented in this report.

Species	Diet sample collection technique	Diet recipient	Diet type
Storm-petrels	Adult shot at or near colony, stomach sample collected by dissection Adult captured at colony with mist net or by hand when reaching into burrows, regurgitation sample collected Chick captured at colony by hand reaching into burrows, regurgitation sample collected	Adult Chick Chick	Stomach Regurgitation Regurgitation
Cormorants	Adult shot at or near colony, stomach sample collected by dissection Immature bird shot at or near colony, stomach sample collected by dissection Bolus collected on ground under nest Chick captured at colony by hand with ladder, regurgitation sample collected	Adult Immature Chick Chick	Stomach Stomach Bolus Regurgitation
Murres	Adult shot at or near colony, stomach sample collected by dissection Adult captured at colony with noose pole, stomach sample collected by lavage Adult captured at colony with noose pole, stomach sample collected by forced regurgitation Bill load observed from adult returning to colony to feed chick Bill load collected from ground after dropped from adult returning to colony to feed chick Bill load collected from bill from adult shot while returning to colony to feed chick Chick collected at colony with noose pole or by hand with ladder or rock climbing; stomach sample collected by dissection Chick captured at colony with noose pole or by hand with ladder or rock climbing; regurgitation sample collected	Adult Adult Adult Chick Chick Chick Chick Chick Chick	Stomach Lavage Regurgitation Bill load Bill load Bill load Stomach Regurgitation
Auklets	Adult shot, captured in mist net and collected, or found dead at or near colony, stomach sample collected by dissection Adult shot at or near colony, regurgitation sample from gular pouch collected by dissection Adult captured at colony with mist net, noose carpets or other; regurgitation sample collected	Adult Chick Chick	Stomach Gular Regurgitation
Puffins (includes RHAU)	Adult shot at or near colony, stomach sample collected by dissection Bill load collected from bill from adult shot while returning to colony to feed chick Chick found dead at colony, stomach sample collected by dissection Bill load observed from adult returning to colony to feed chick Bill load collected at nest after dropped by adult due to burrow screen, net, chick muzzle, fishing net, noose carpet or other	Adult Chick Chick Chick Chick	Stomach Bill load Stomach Bill load Bill load
Kittiwakes	Adult shot at or near colony, stomach sample collected by dissection Adult captured at colony with noose pole or foot snare, stomach sample (and sometimes regurgitation) collected by lavage Immature bird shot at or near colony, stomach sample collected by dissection Adult captured at colony with noose pole, foot snare or mist net; regurgitation sample collected Chick collected or found dead at colony, stomach sample collected by dissection Chick captured at colony with noose pole, foot snare or by hand with ladder or rock climbing; regurgitation sample collected	Adult Adult+Chick Immature Chick Chick Chick	Stomach Lavage Stomach Regurgitation Stomach Regurgitation
Gulls	Adult shot at or near colony, stomach sample collected by dissection Regurgitated pellet collected from ground, left by adult Chick captured by hand, regurgitation sample collected Regurgitated bolus collected from nest, left by adult for chick	Adult Adult Chick Chick	Stomach Pellet Regurgitation Bolus
Other species	Adult shot at or near colony, stomach sample collected by dissection (many species) Prey remains collected at nest (black oystercatcher) Chick captured at colony, regurgitation sample collected (northern fulmar) Bill load collected from ground or by burrow screen from adult returning to colony to feed chick (pigeon guillemot)	Adult Chick Chick Chick	Stomach Prey pile Regurgitation Bill load

Table 2. Complete list of avian (mostly seabird) diet datasets from the Alaska Maritime National Wildlife Refuge, presented by species in taxonomic order. Datasets summarized in this report (those with ≥ 5 years data or ongoing sampling) are shown in red; additional datasets that exist but are not summarized in this report (<5 years data and not ongoing sampling) are shown in black. Years in parentheses indicate all samples from that year were empty.

Table 2 (continued). Complete list of avian (mostly seabird) diet datasets from the Alaska Maritime National Wildlife Refuge, presented by species in taxonomic order. Datasets summarized in this report (those with ≥ 5 years data or ongoing sampling) are shown in red; additional datasets that exist but are not summarized in this report (<5 years data and not ongoing sampling) are shown in black. Years in parentheses indicate all samples from that year were empty.

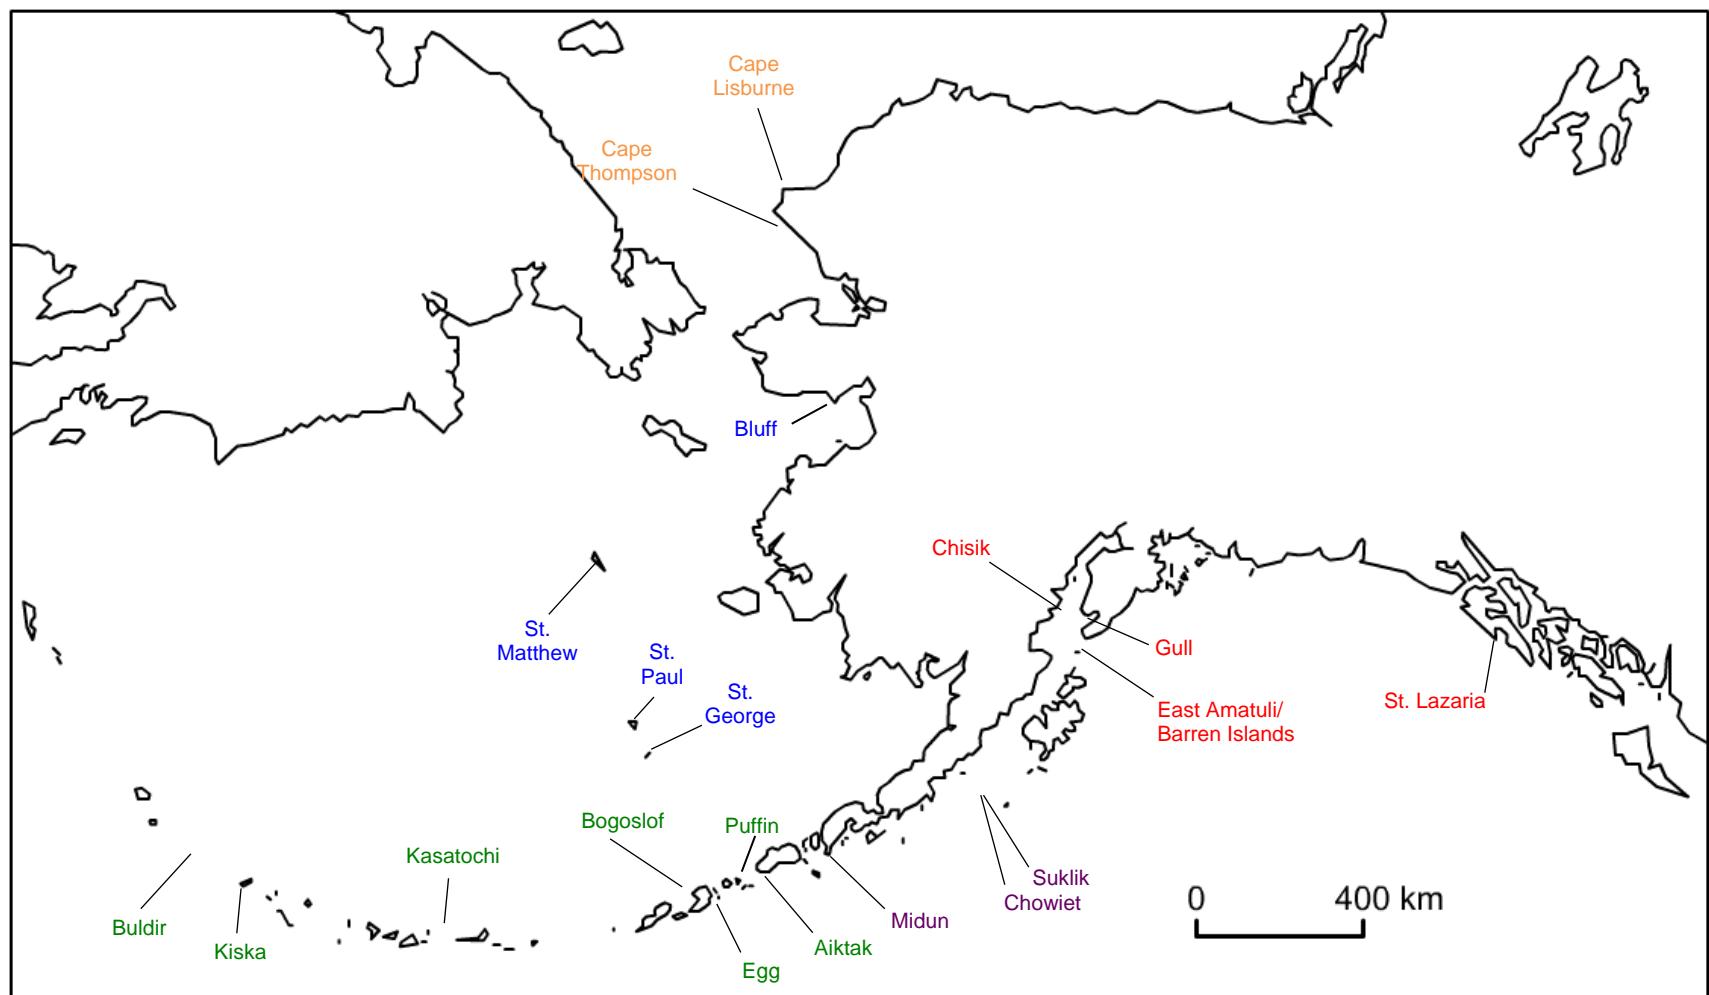

Figure 1. Sites with seabird diet data presented in this report. Colors indicate geographic units; red = Gulf of Alaska, purple = Alaska Peninsula, green = Aleutian Islands, blue = Bering Sea, orange = Chukchi Sea.

DIET FIGURES

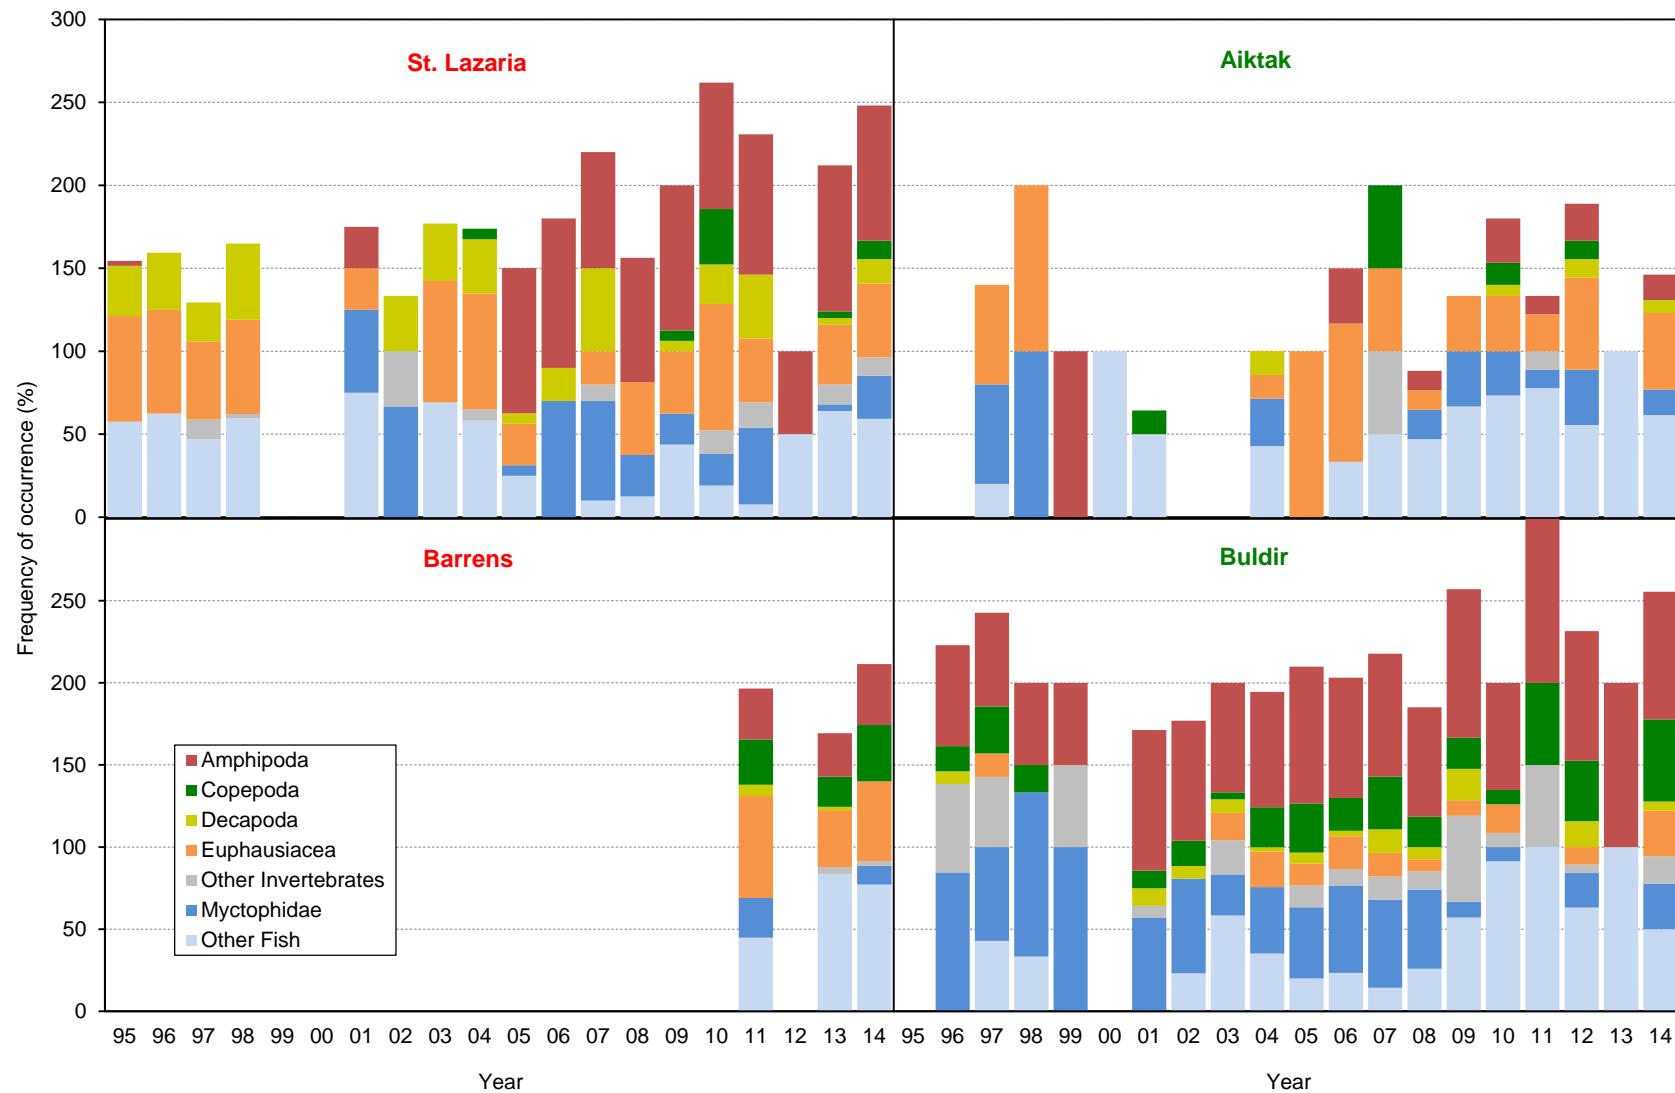

Figure 2. Frequency of occurrence of major prey items in diets of fork-tailed storm-petrel chicks at sites within the Alaska Maritime National Wildlife Refuge. Frequency is expressed as the percentage of food samples in which each prey item was present. Samples consist of regurgitations from adults returning to the colony to feed chicks; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; red = Gulf of Alaska, green = Aleutian Islands.

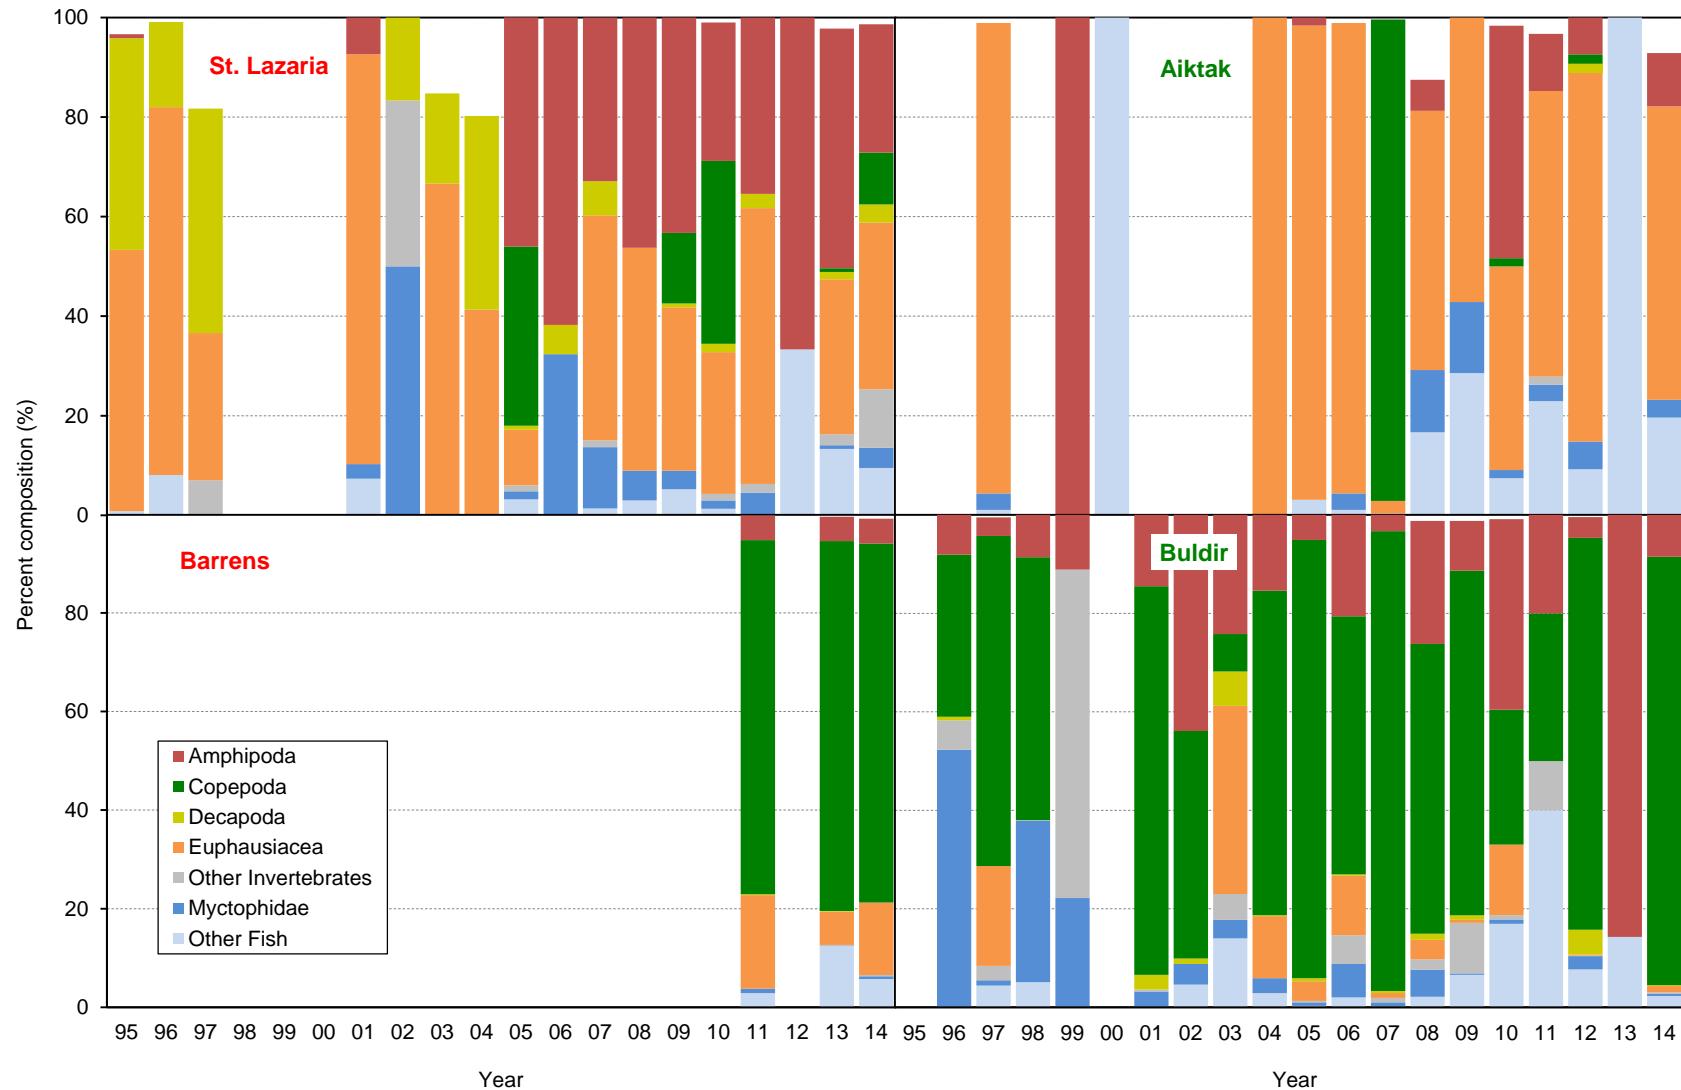

Figure 3. Percent composition of major prey items in diets of fork-tailed storm-petrel chicks at sites within the Alaska Maritime National Wildlife Refuge. Values are expressed as the percentage of total individual prey items comprised by each prey item. Samples consist of regurgitations from adults returning to the colony to feed chicks; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; red = Gulf of Alaska, green = Aleutian Islands.

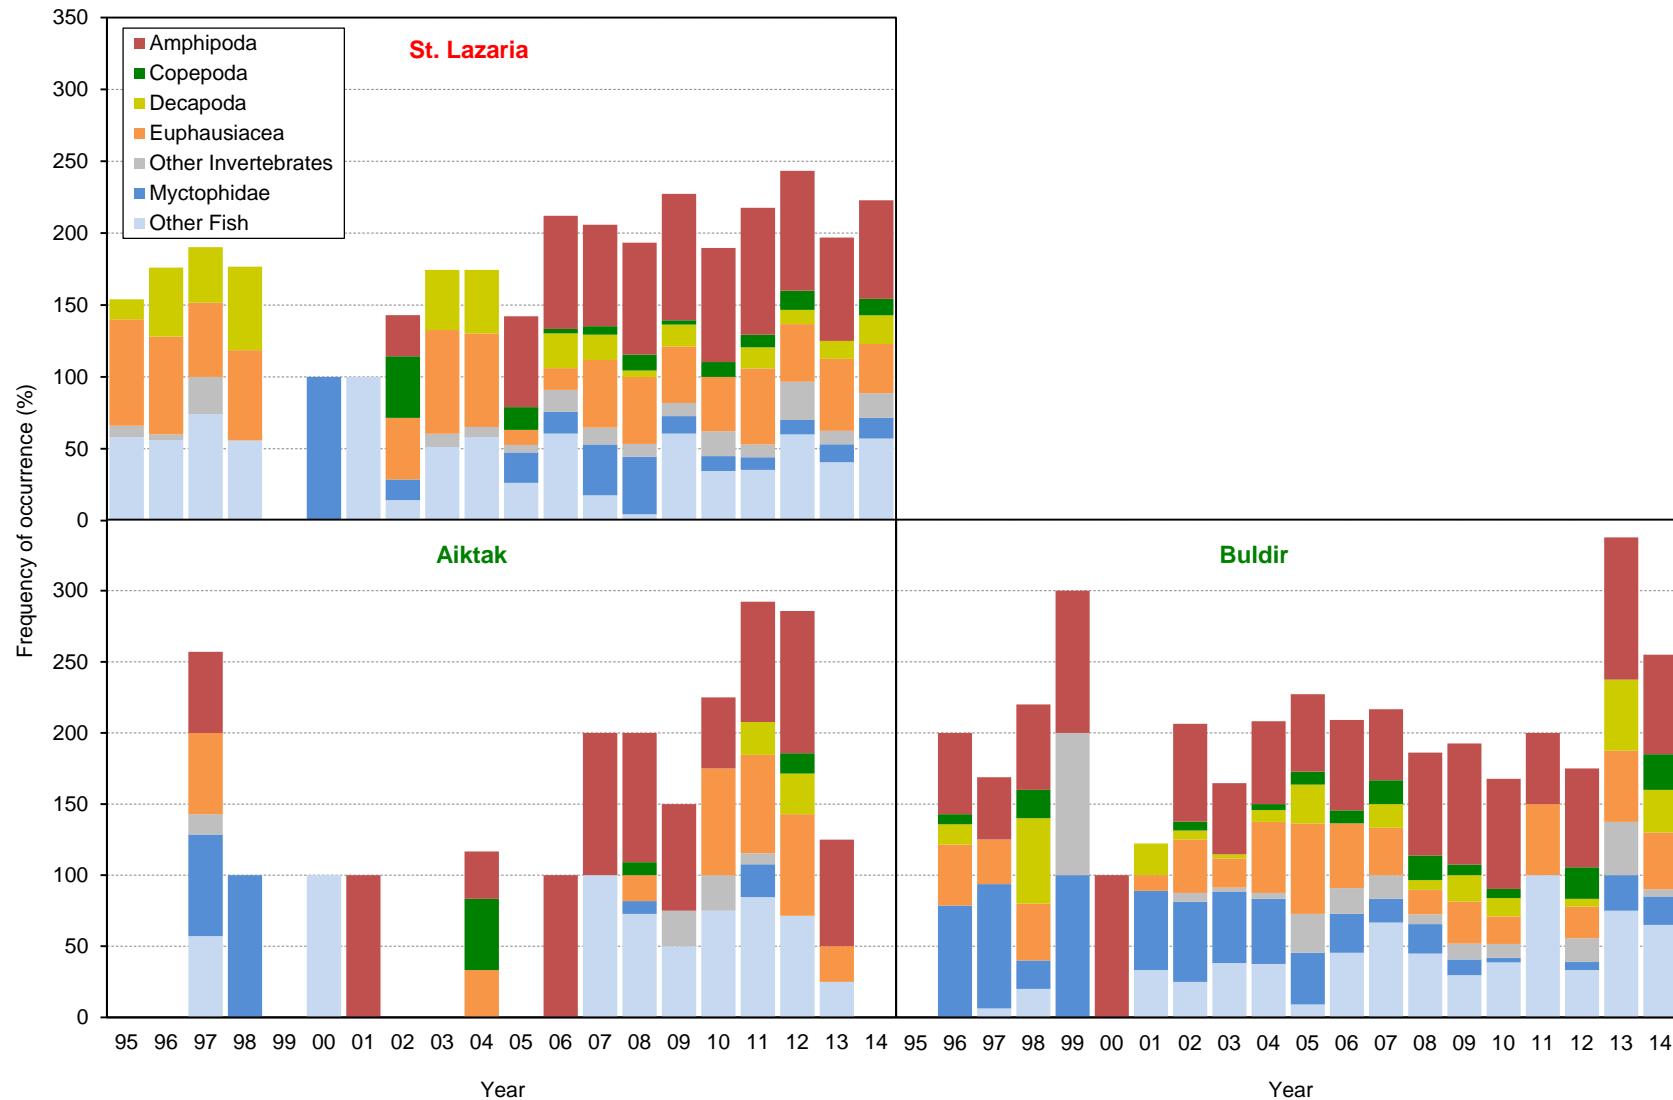

Figure 4. Frequency of occurrence of major prey items in diets of Leach's storm-petrel chicks at sites within the Alaska Maritime National Wildlife Refuge. Frequency is expressed as the percentage of food samples in which each prey item was present. Samples consist of regurgitations from adults returning to the colony to feed chicks; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; red = Gulf of Alaska, green = Aleutian Islands.

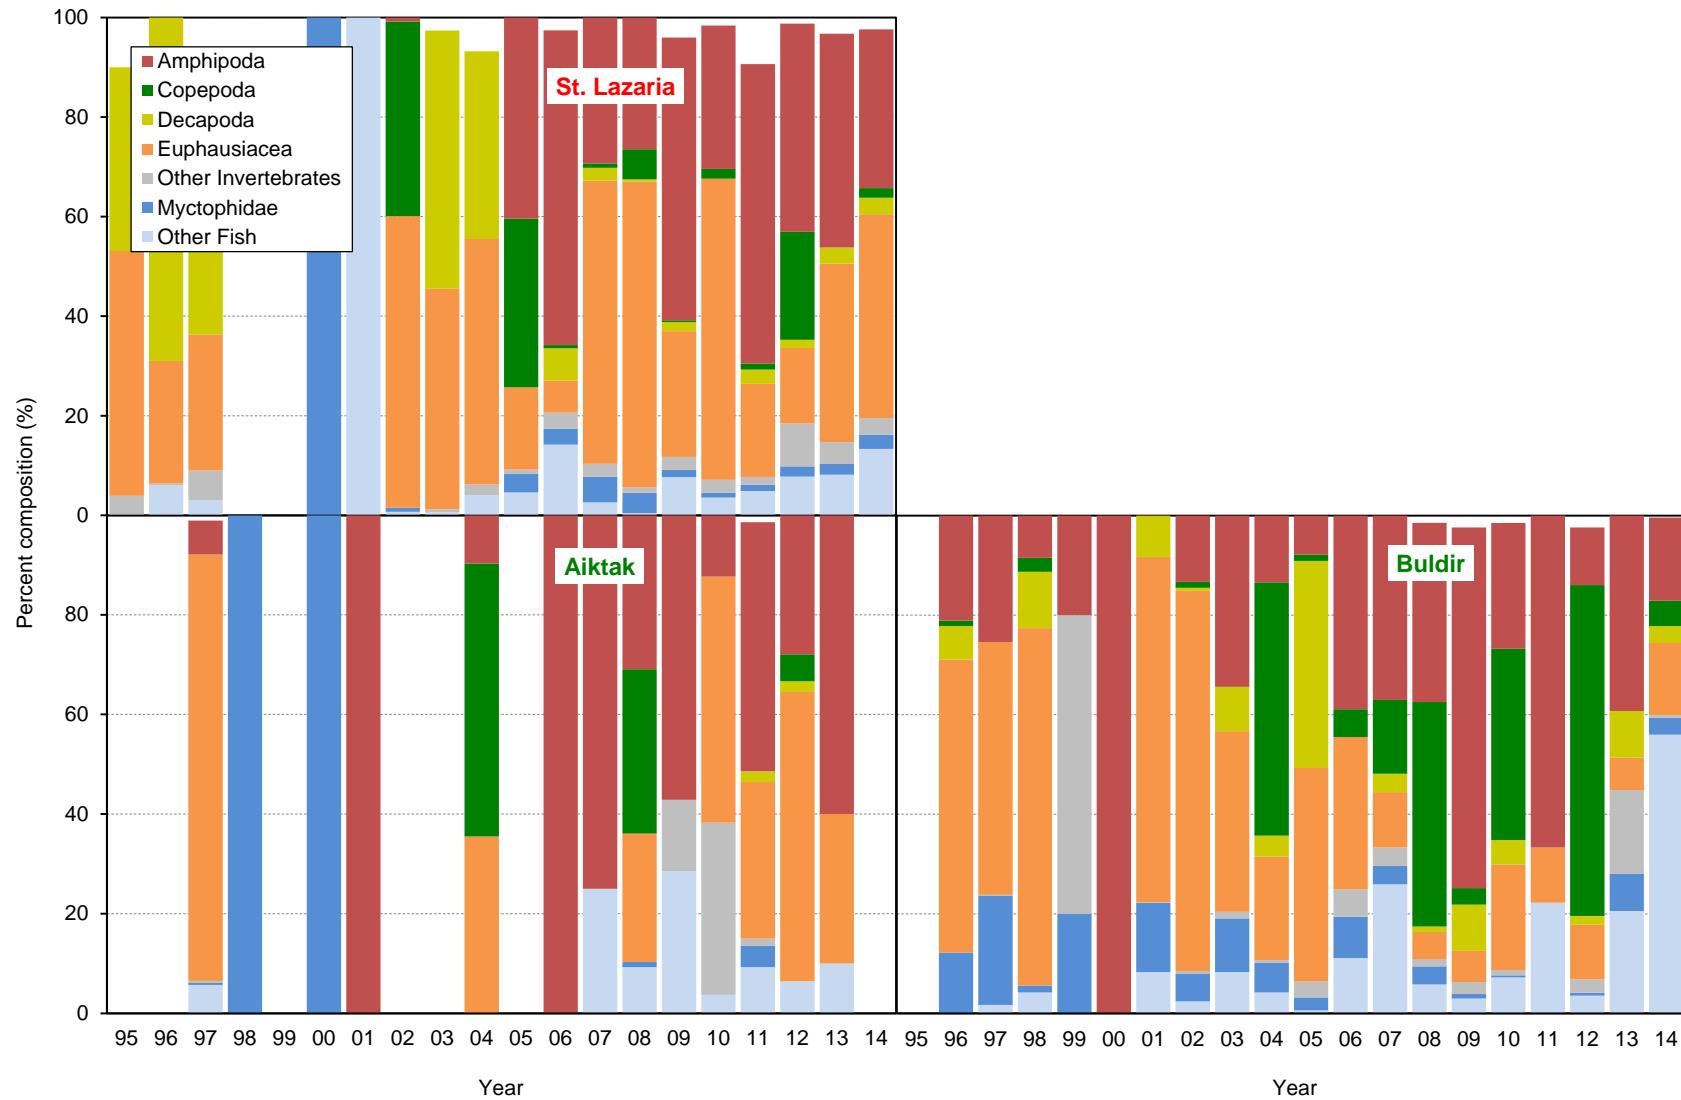

Figure 5. Percent composition of major prey items in diets of Leach's storm-petrel chicks at sites within the Alaska Maritime National Wildlife Refuge. Values are expressed as the percentage of total individual prey items comprised by each prey item. Samples consist of regurgitations from adults returning to the colony to feed chicks; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; red = Gulf of Alaska, green = Aleutian Islands.

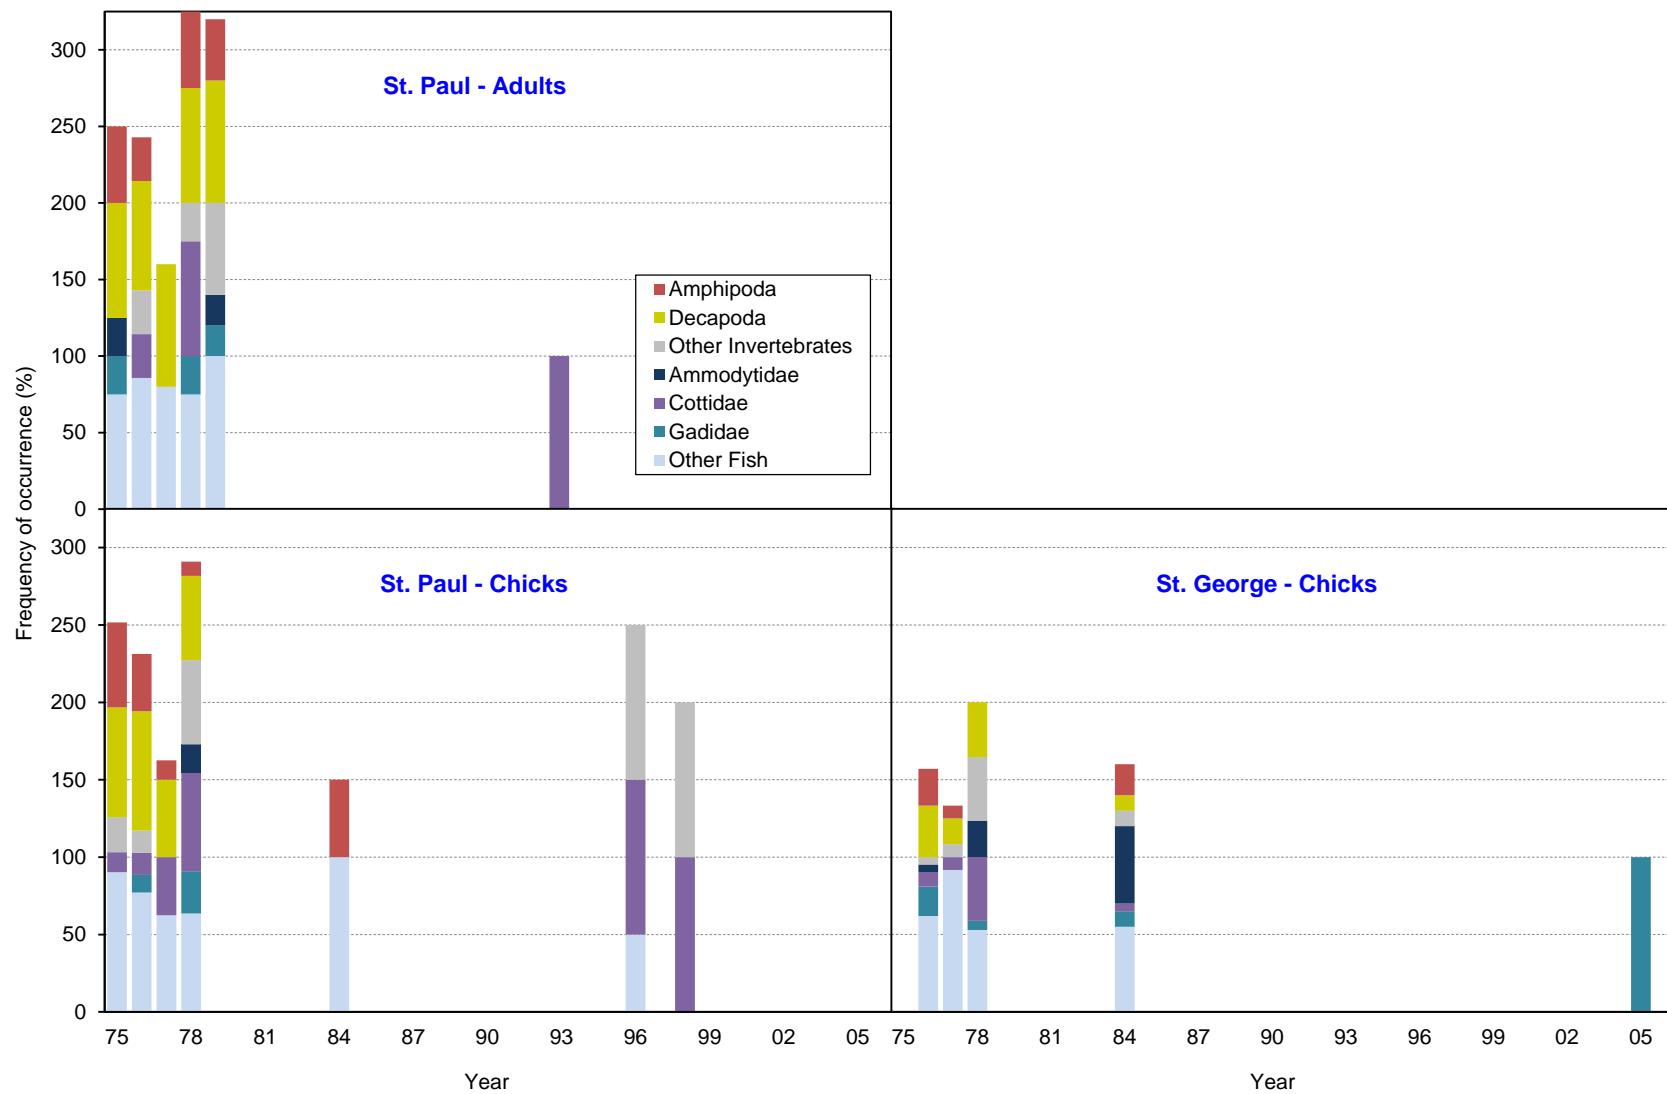

Figure 6. Frequency of occurrence of prey items in diets of red-faced cormorant adults and chicks at sites within the Alaska Maritime National Wildlife Refuge. Frequency is expressed as the percentage of food samples in which each prey item was present. Adult samples consist of stomach contents from adults collected at or near the colony and chick samples consist of boluses collected from the ground and regurgitations collected from chicks at the colony; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; blue = Bering Sea.

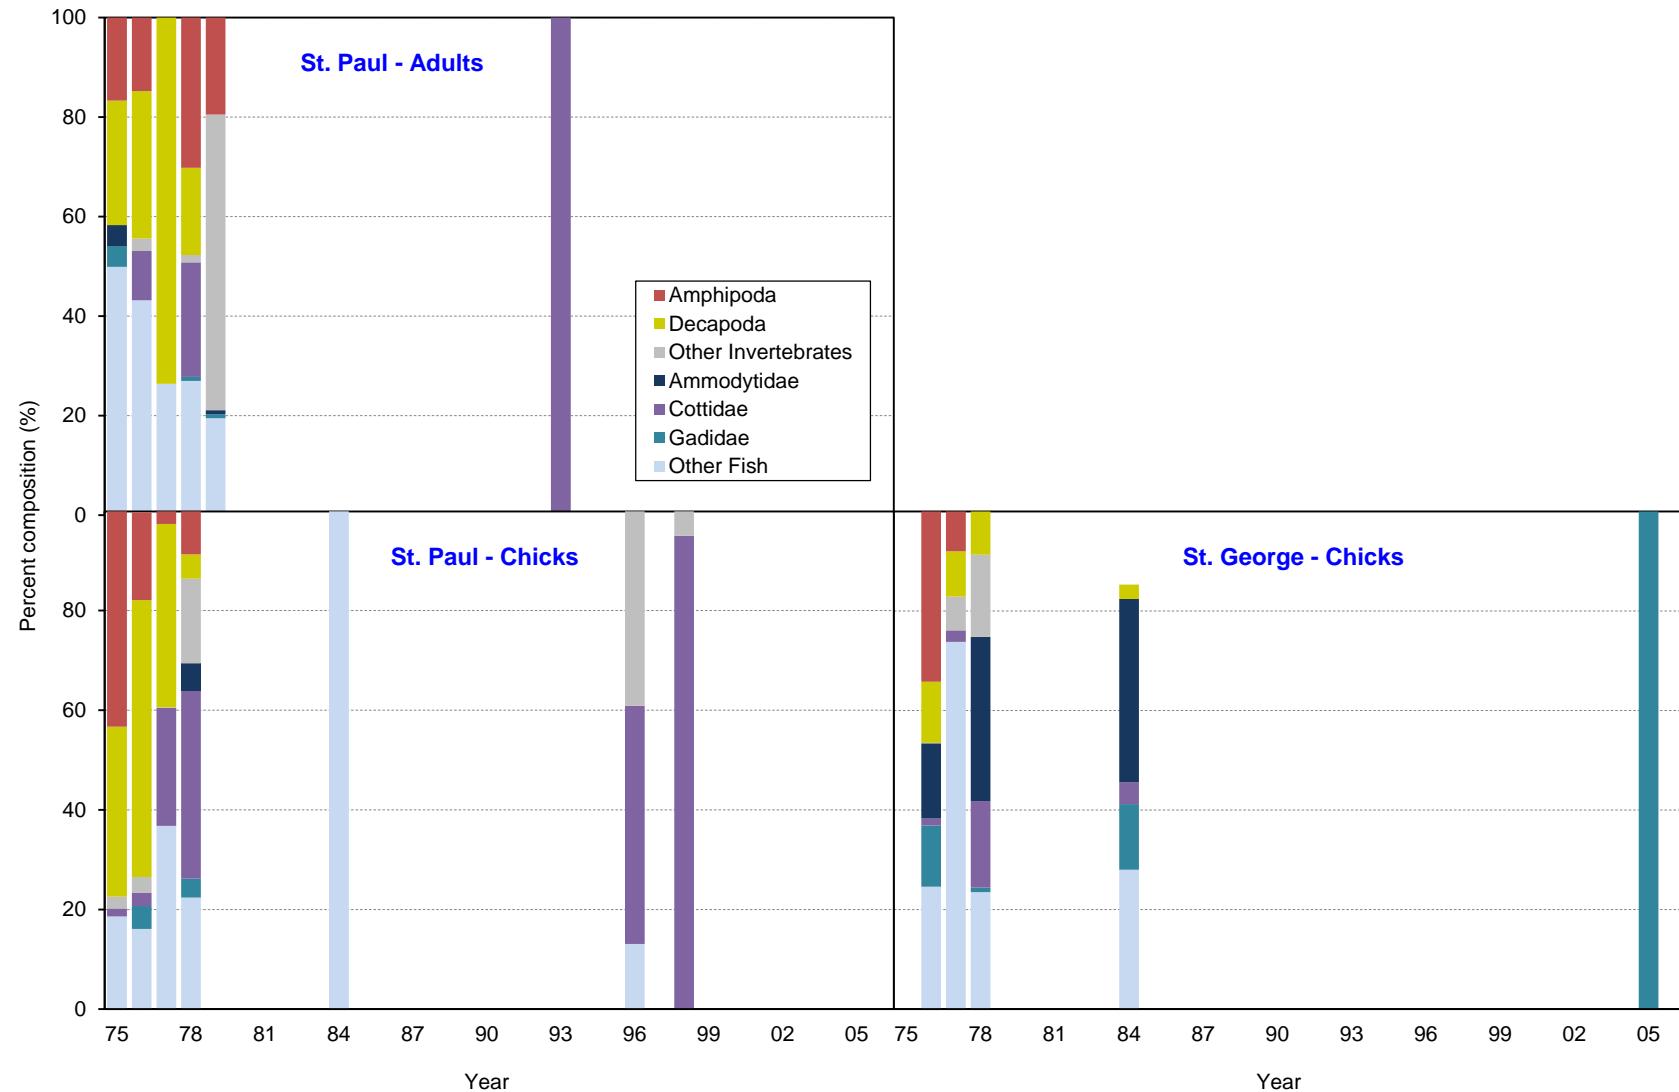

Figure 7. Percent composition of prey items in diets of red-faced cormorant adults and chicks at sites within the Alaska Maritime National Wildlife Refuge. Values are expressed as the percentage of total individual prey items comprised by each prey item. Adult samples consist of stomach contents from adults collected at or near the colony and chick samples consist of boluses collected from the ground and regurgitations collected from chicks at the colony; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; blue = Bering Sea.

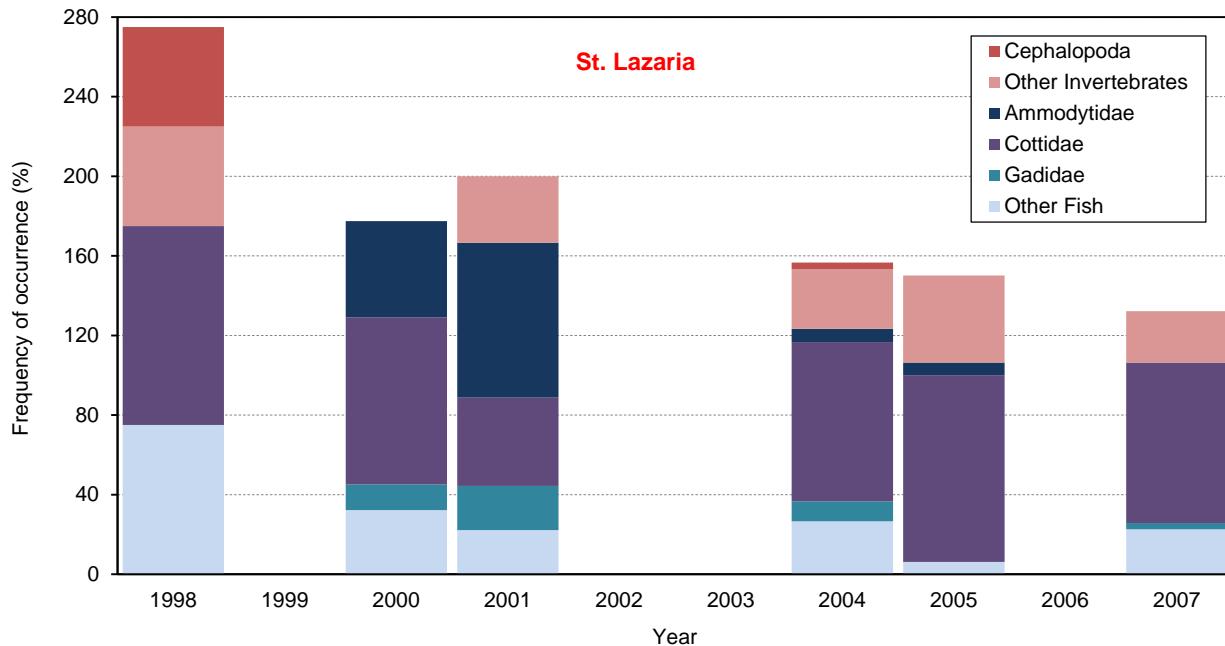

Figure 8. Frequency of occurrence of prey items in diets of pelagic cormorant chicks at sites within the Alaska Maritime National Wildlife Refuge. Frequency is expressed as the percentage of food samples in which each prey item was present. Samples consist of bill loads collected from adults returning to the colony to feed chicks; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; red = Gulf of Alaska.

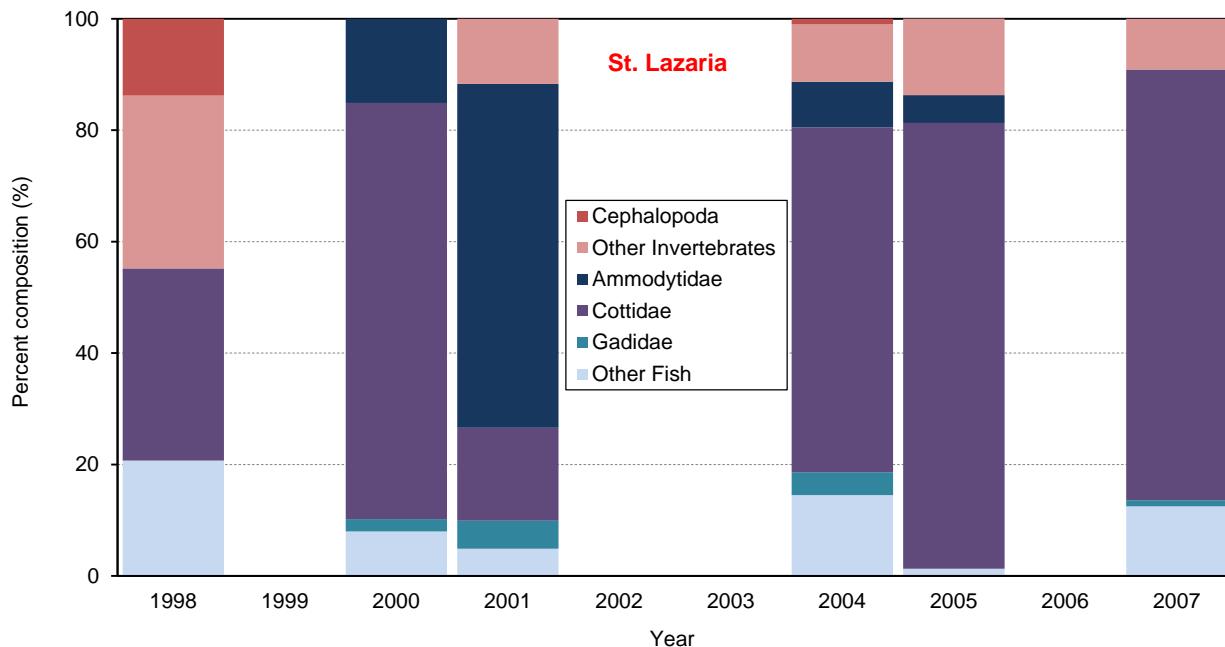

Figure 9. Percent composition of prey items in diets of pelagic cormorant chicks at sites within the Alaska Maritime National Wildlife Refuge. Values are expressed as the percentage of total individual prey items comprised by each prey item. Samples consist of bill loads collected from adults returning to the colony to feed chicks; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; red = Gulf of Alaska.

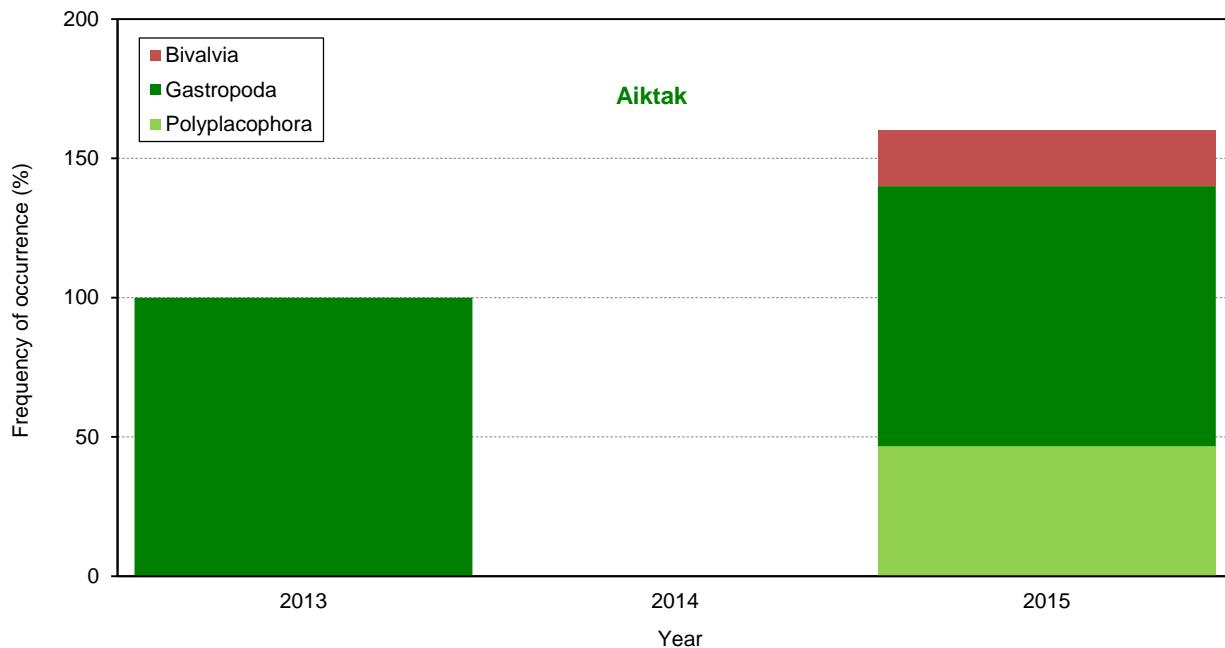

Figure 10. Frequency of occurrence of major prey items in diets of black oystercatcher chicks at sites within the Alaska Maritime National Wildlife Refuge. Frequency is expressed as the percentage of food samples in which each prey item was present. Samples consist of prey piles collected at nests at the colony; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; green = Aleutian Islands.

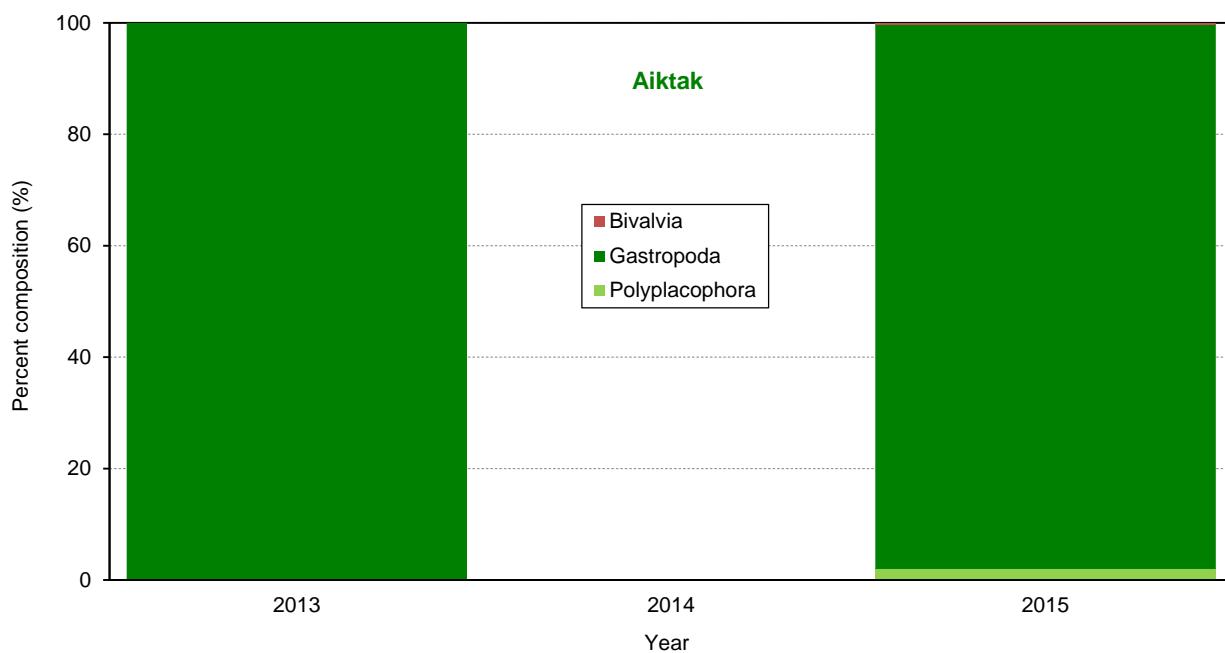

Figure 11. Percent composition of major prey items in diets of black oystercatcher chicks at sites within the Alaska Maritime National Wildlife Refuge. Values are expressed as the percentage of total individual prey items comprised by each prey item. Samples consist of prey piles collected at nests at the colony; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; green = Aleutian Islands.

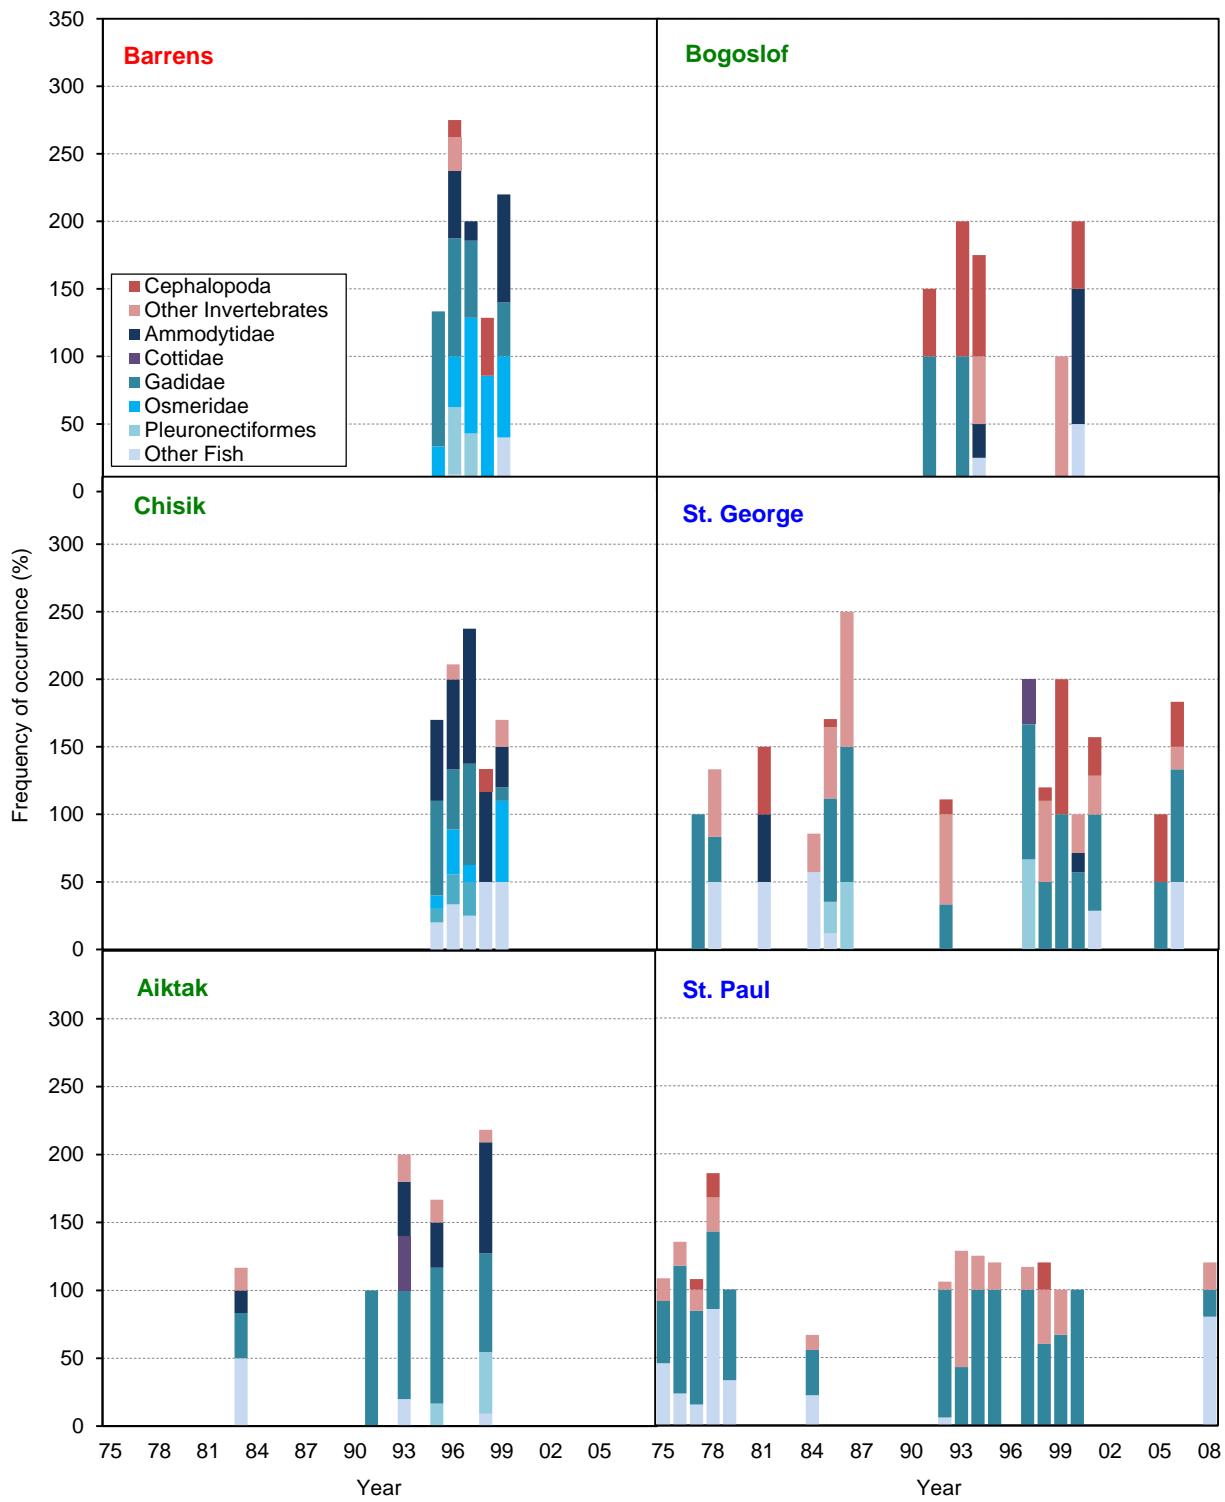

Figure 12. Frequency of occurrence of major prey items in diets of common murre adults at sites within the Alaska Maritime National Wildlife Refuge. Frequency is expressed as the percentage of food samples in which each prey item was present. Samples consist of stomach contents from adults collected or lavaged at or near the colony and regurgitation samples from adults; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; red = Gulf of Alaska, green = Aleutian Islands, blue = Bering Sea, orange = Chukchi Sea.

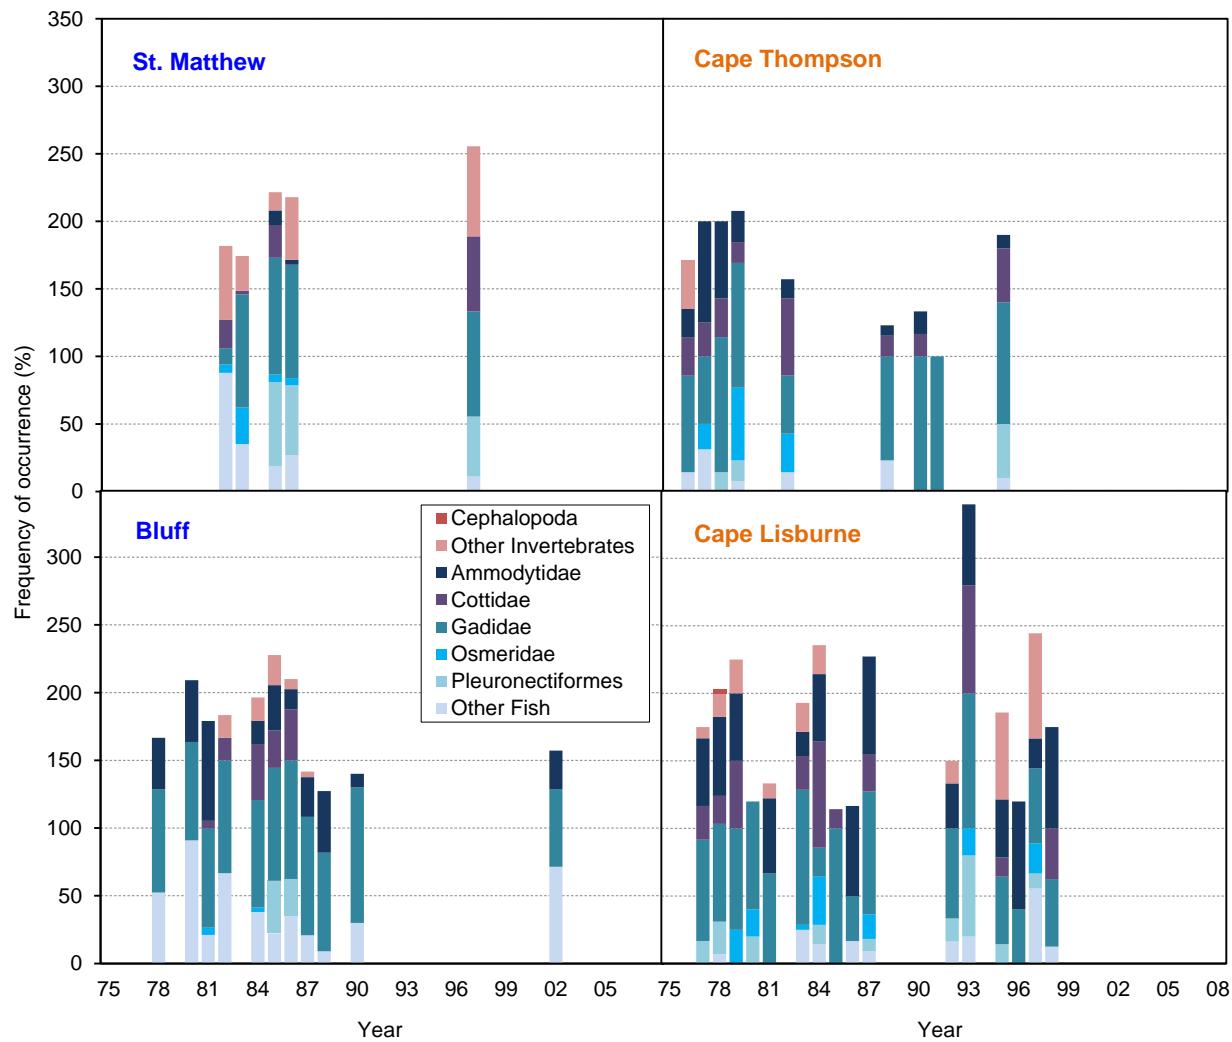

Figure 12 (continued). Frequency of occurrence of major prey items in diets of common murre adults at sites within the Alaska Maritime National Wildlife Refuge. Frequency is expressed as the percentage of food samples in which each prey item was present. Samples consist of stomach contents from adults collected or lavaged at or near the colony and regurgitation samples from adults; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; red = Gulf of Alaska, green = Aleutian Islands, blue = Bering Sea, orange = Chukchi Sea.

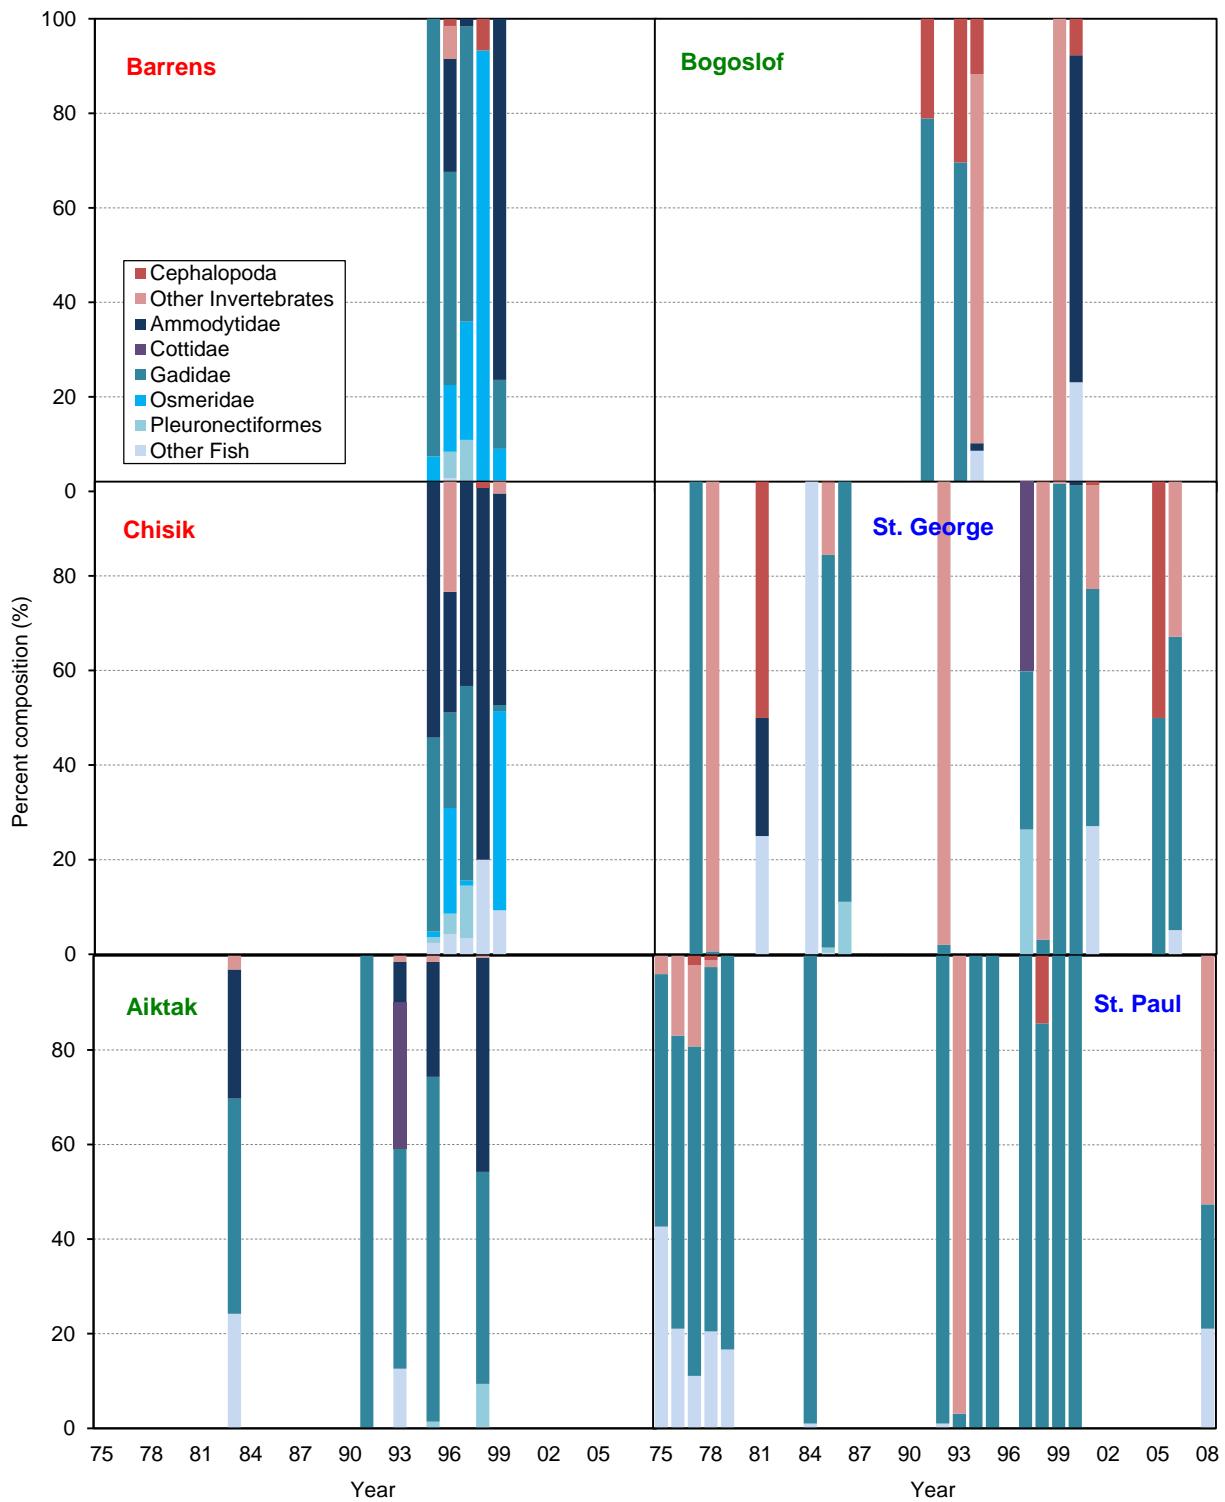

Figure 13. Percent composition of major prey items in diets of common murre adults at sites within the Alaska Maritime National Wildlife Refuge. Values are expressed as the percentage of total individual prey items comprised by each prey item. Samples consist of stomach contents from adults collected or lavaged at or near the colony and regurgitation samples from adults; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; red = Gulf of Alaska, green = Aleutian Islands, blue = Bering Sea, orange = Chukchi Sea.

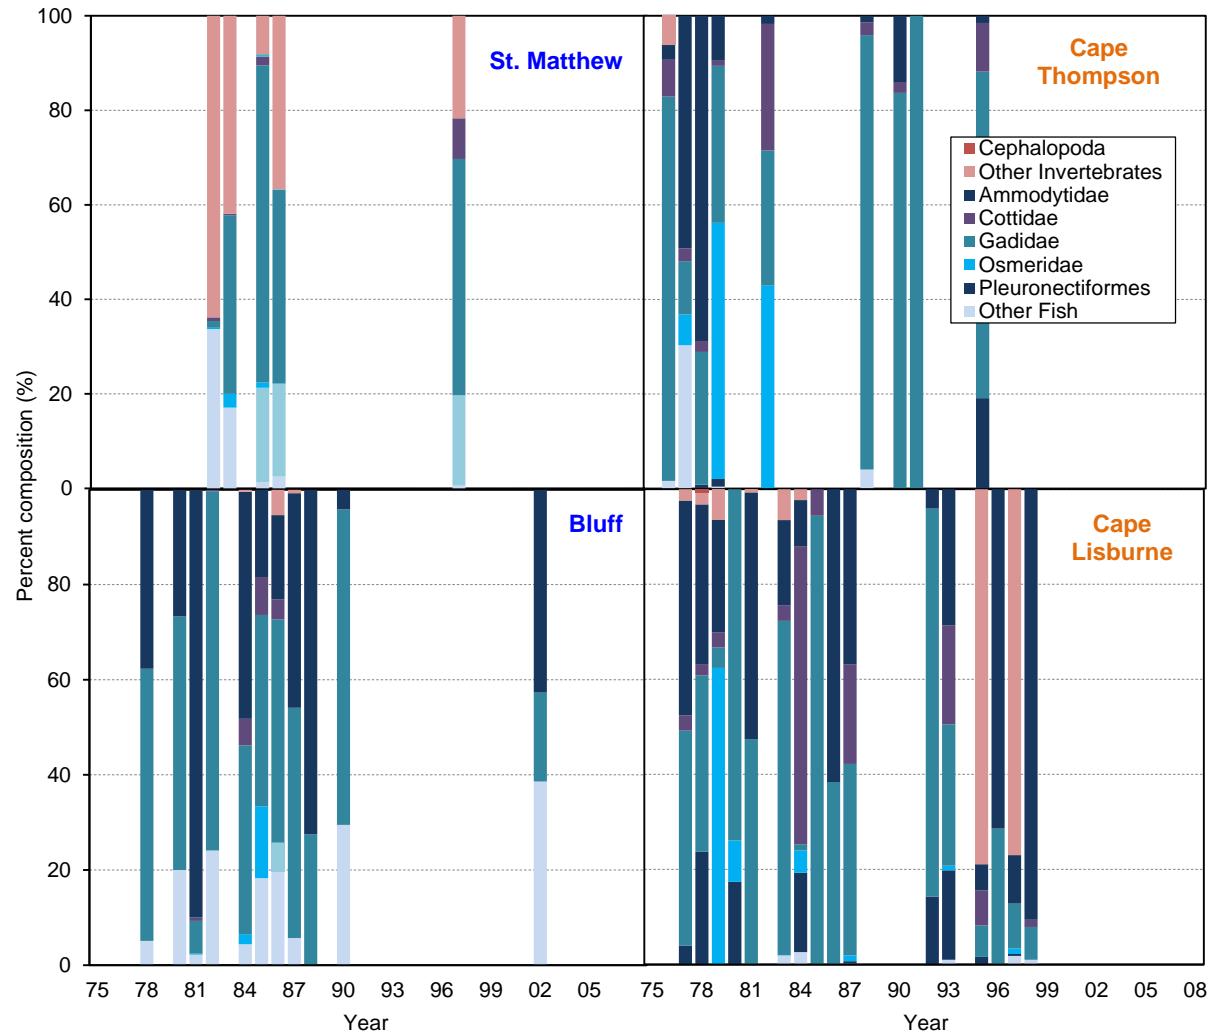

Figure 13 (continued). Percent composition of major prey items in diets of common murre adults at sites within the Alaska Maritime National Wildlife Refuge. Values are expressed as the percentage of total individual prey items comprised by each prey item. Samples consist of stomach contents from adults collected or lavaged at or near the colony and regurgitation samples from adults; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; red = Gulf of Alaska, green = Aleutian Islands, blue = Bering Sea, orange = Chukchi Sea.

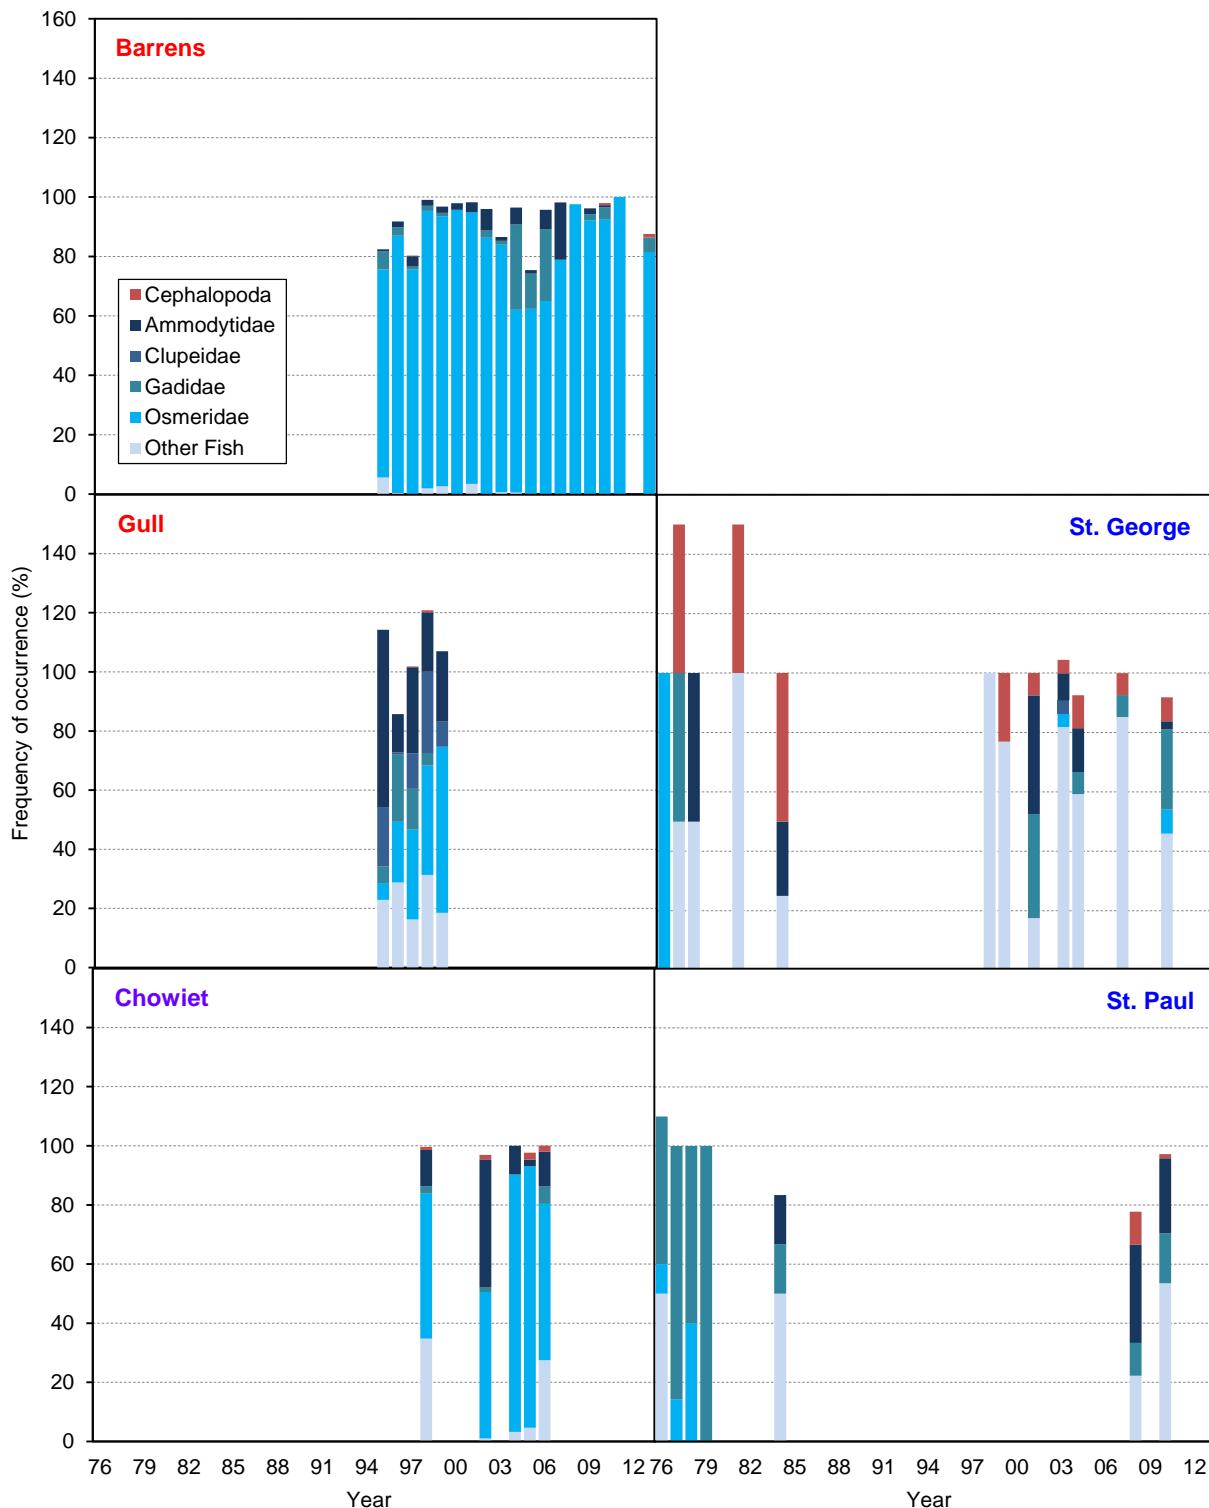

Figure 14. Frequency of occurrence of major prey items in diets of common murre chicks at sites within the Alaska Maritime National Wildlife Refuge. Frequency is expressed as the percentage of food samples in which each prey item was present. Samples consist of observations of bill loads from adults returning to the colony to feed chicks, collections of bill loads dropped by adults at the colony, and stomach contents and regurgitations collected from chicks at the colony; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; red = Gulf of Alaska, purple = Alaska Peninsula, blue = Bering Sea.

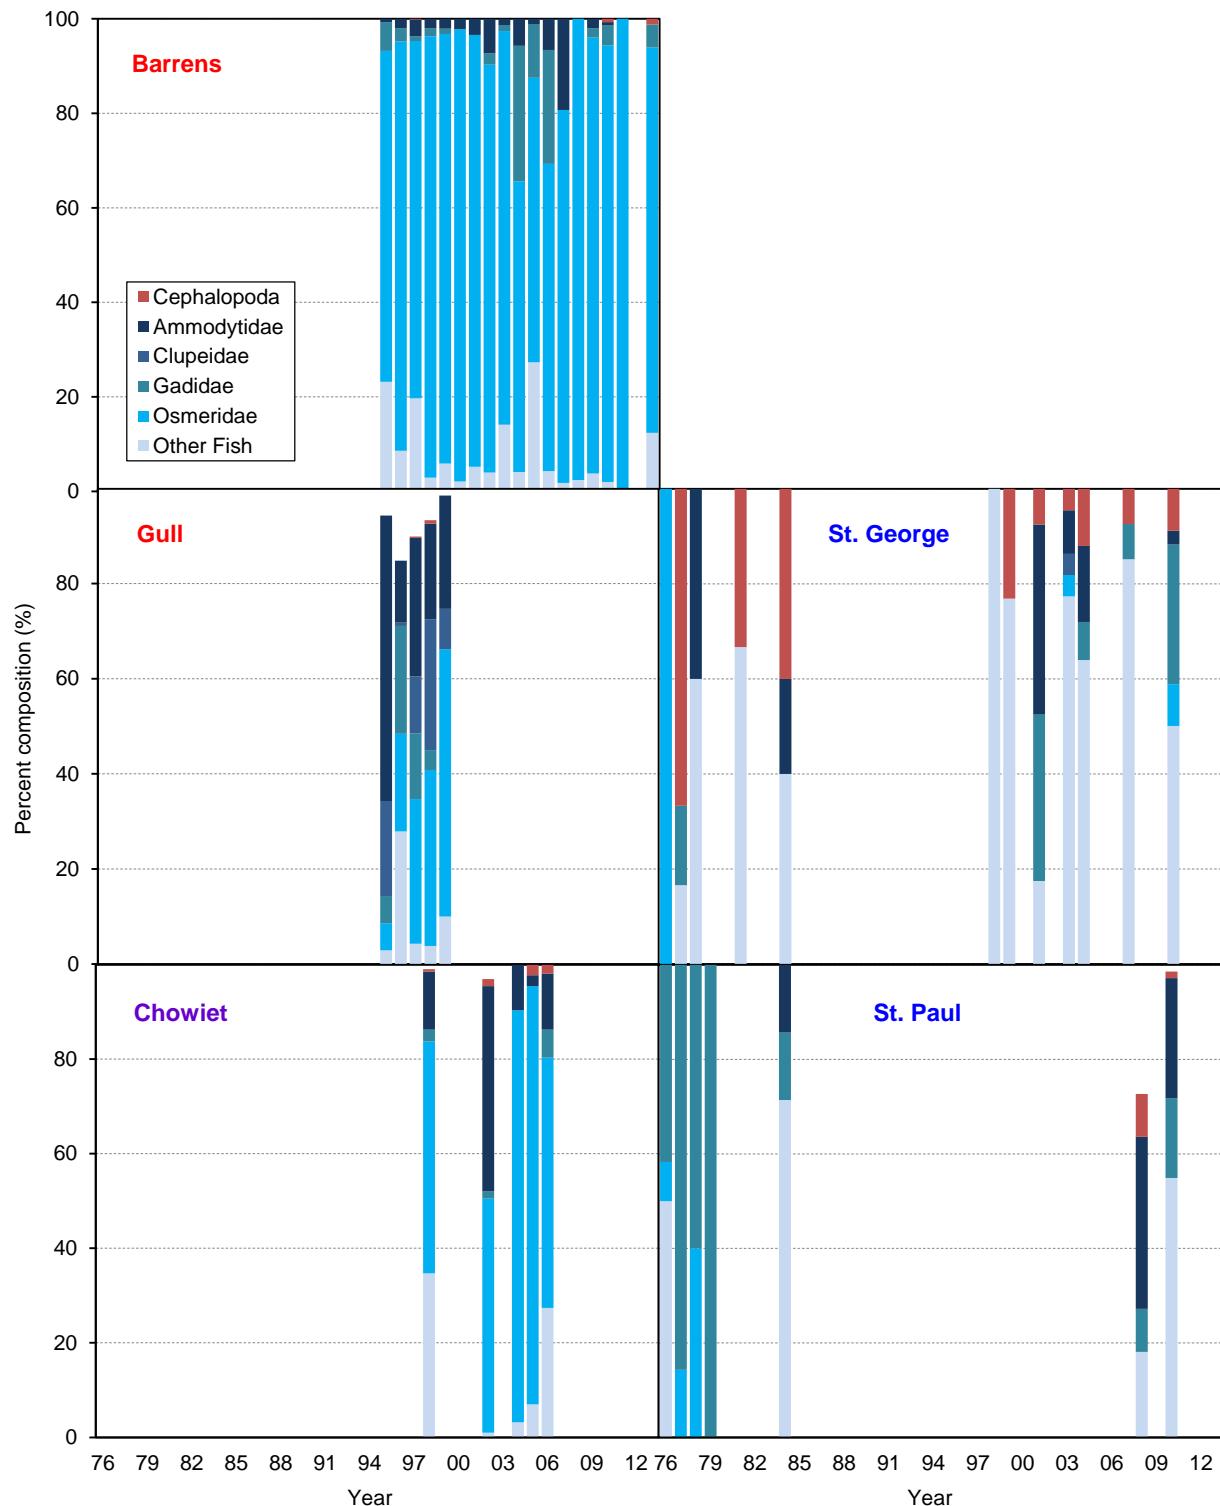

Figure 15. Percent composition of major prey items in diets of common murre chicks at sites within the Alaska Maritime National Wildlife Refuge. Values are expressed as the percentage of total individual prey items comprised by each prey item. Samples consist of observations of bill loads from adults returning to the colony to feed chicks, collections of bill loads dropped by adults at the colony, and stomach contents and regurgitations collected from chicks at the colony; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; red = Gulf of Alaska, purple = Alaska Peninsula, blue = Bering Sea.

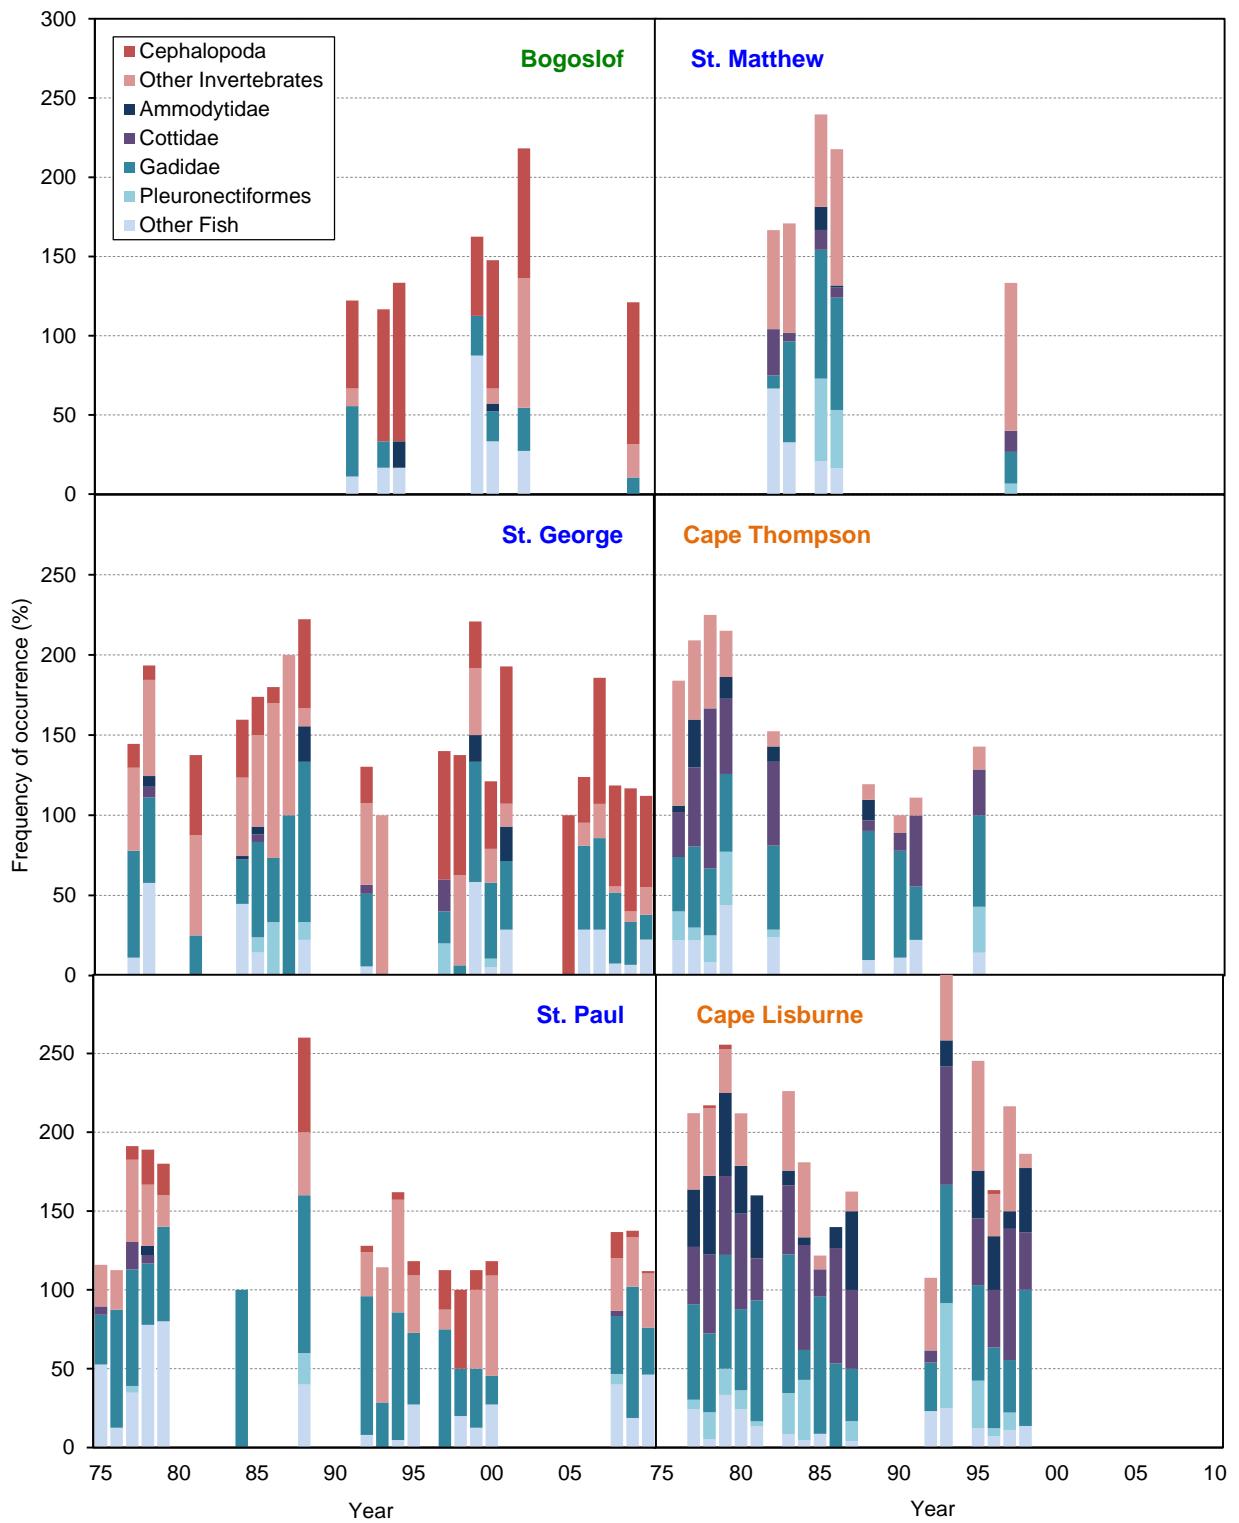

Figure 16. Frequency of occurrence of major prey items in diets of thick-billed murre adults at sites within the Alaska Maritime National Wildlife Refuge. Frequency is expressed as the percentage of food samples in which each prey item was present. Samples consist of stomach contents from adults collected or lavaged at or near the colony and regurgitation samples from adults; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; green = Aleutian Islands, blue = Bering Sea, orange = Chukchi Sea.

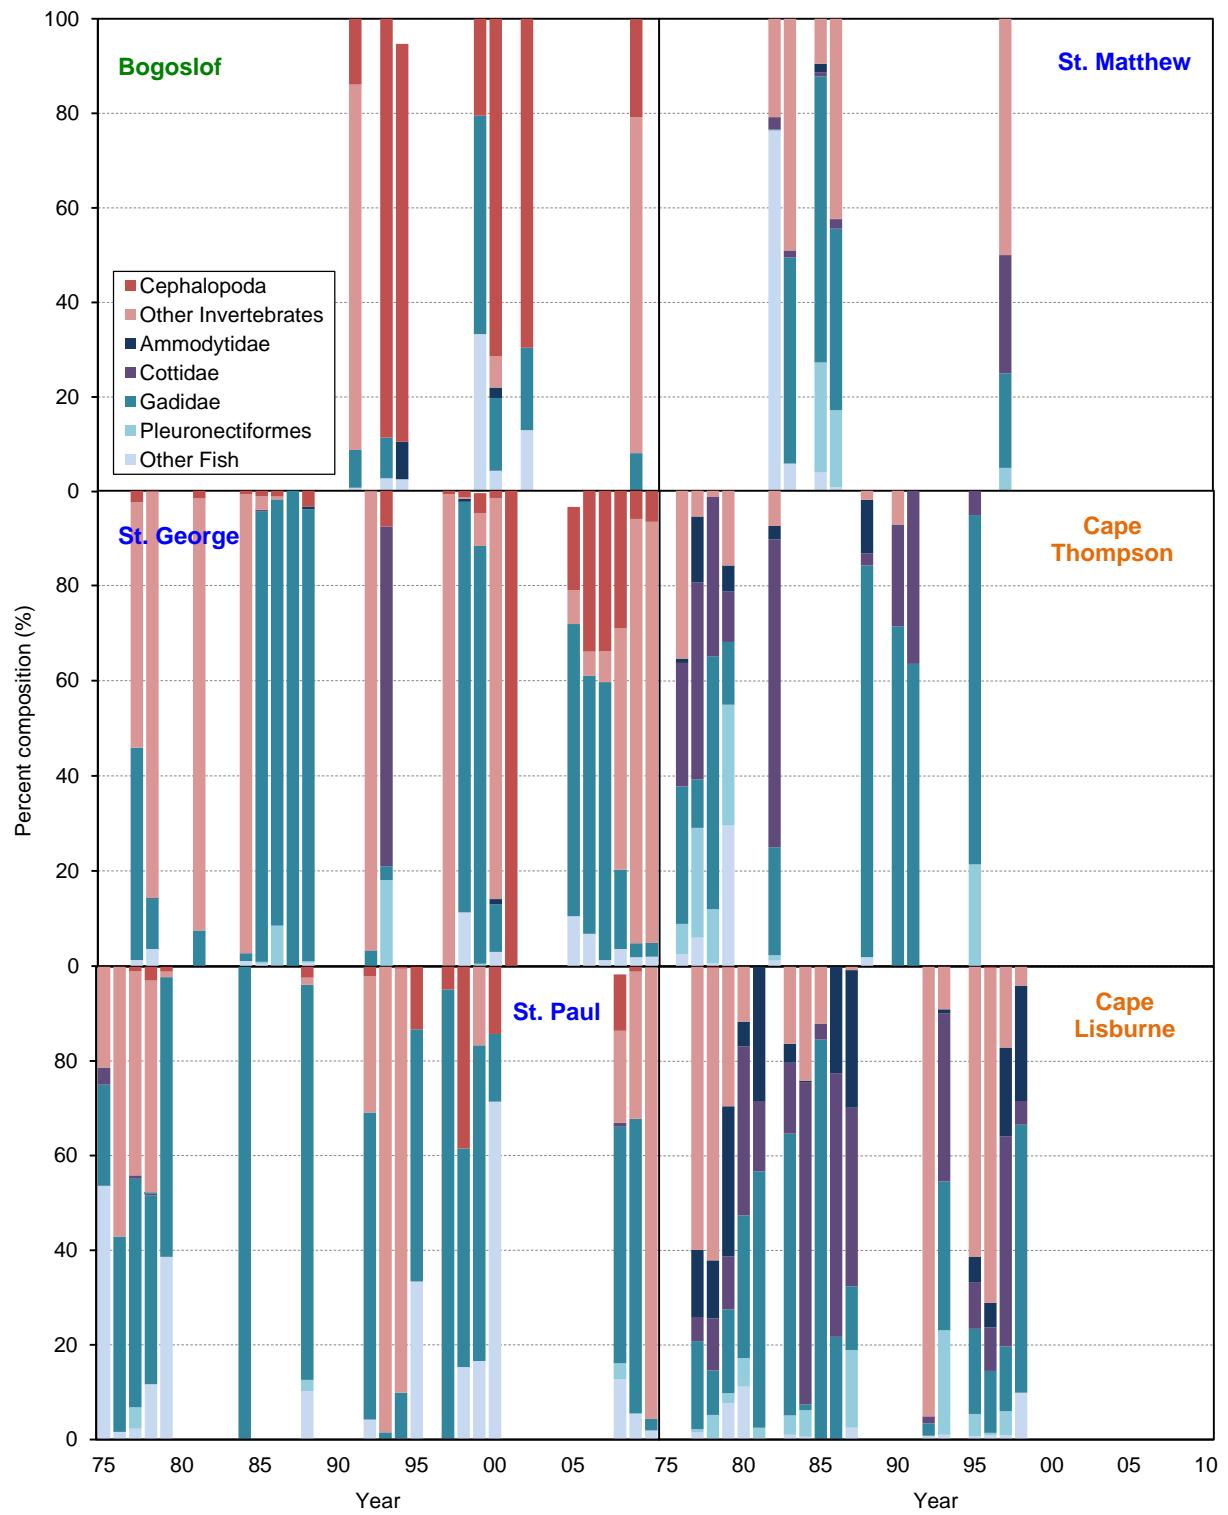

Figure 17. Percent composition of major prey items in diets of thick-billed murre adults at sites within the Alaska Maritime National Wildlife Refuge. Values are expressed as the percentage of total individual prey items comprised by each prey item. Samples consist of stomach contents from adults collected or lavaged at or near the colony and regurgitation samples from adults; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; green = Aleutian Islands, blue = Bering Sea, orange = Chukchi Sea.

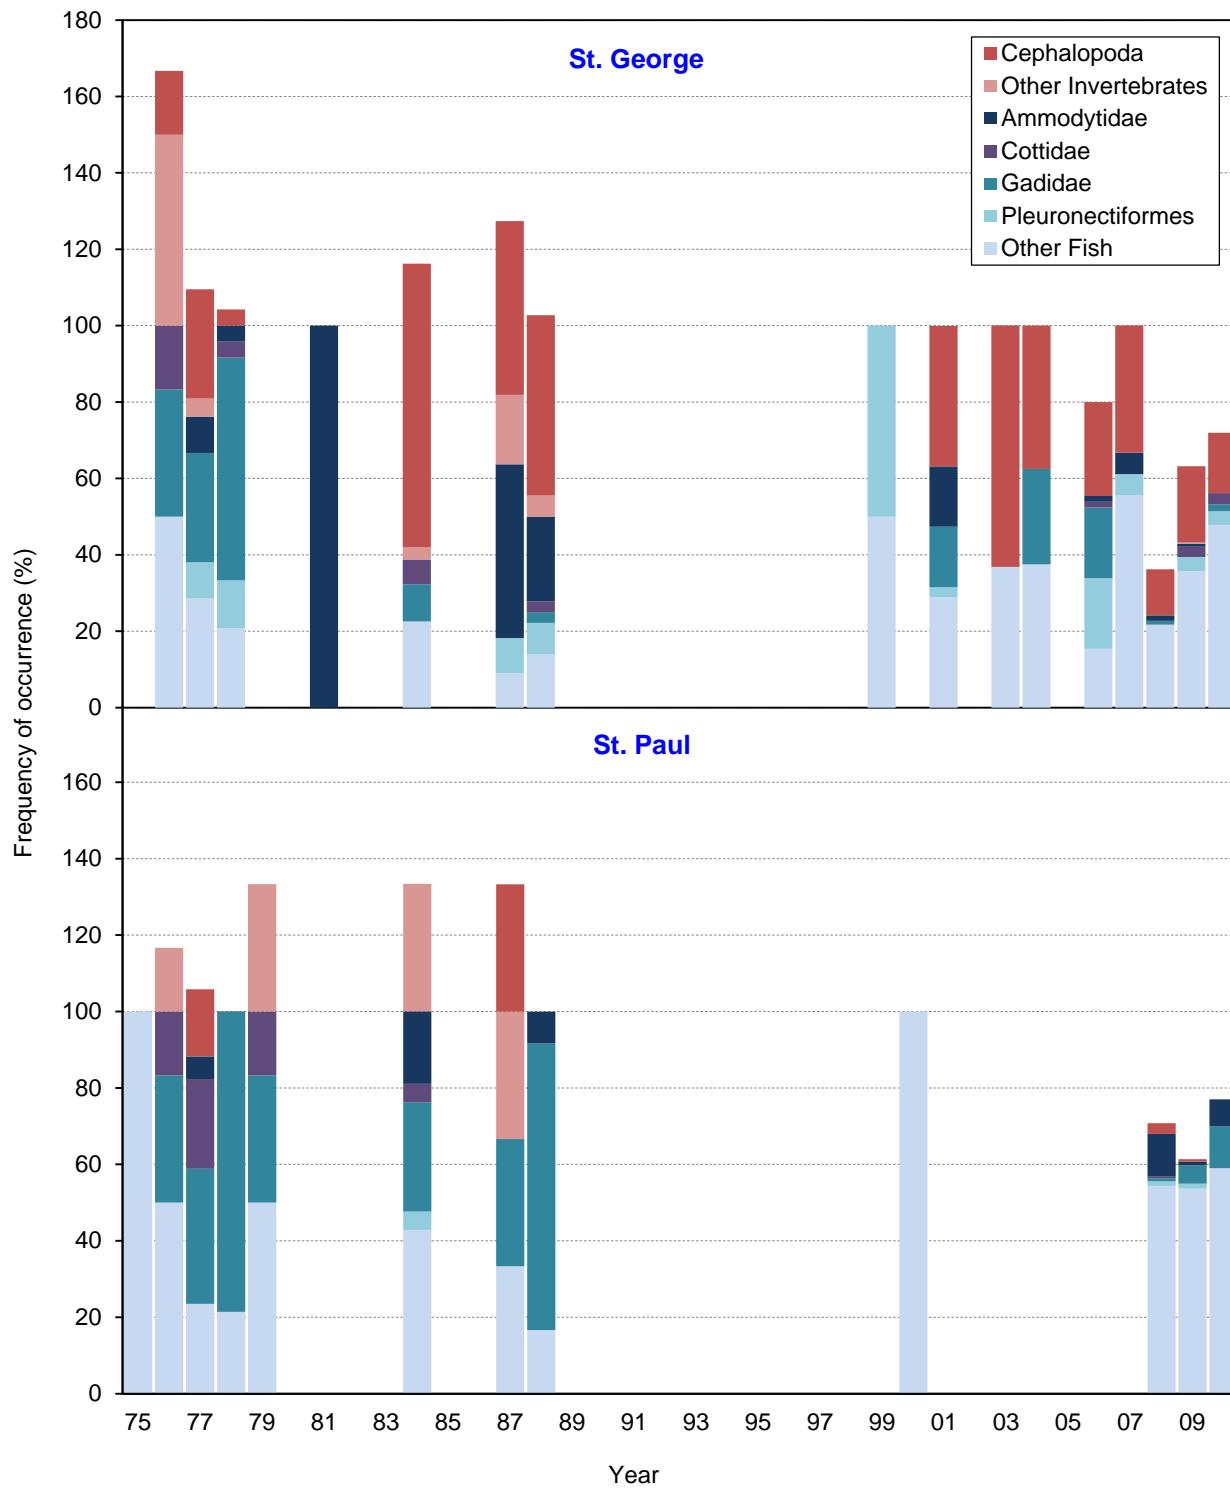

Figure 18. Frequency of occurrence of major prey items in diets of thick-billed murre chicks at sites within the Alaska Maritime National Wildlife Refuge. Frequency is expressed as the percentage of food samples in which each prey item was present. Samples consist of observations of bill loads from adults returning to the colony to feed chicks, collections of bill loads dropped by adults at the colony and regurgitations collected from chicks at the colony ; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; blue = Bering Sea.

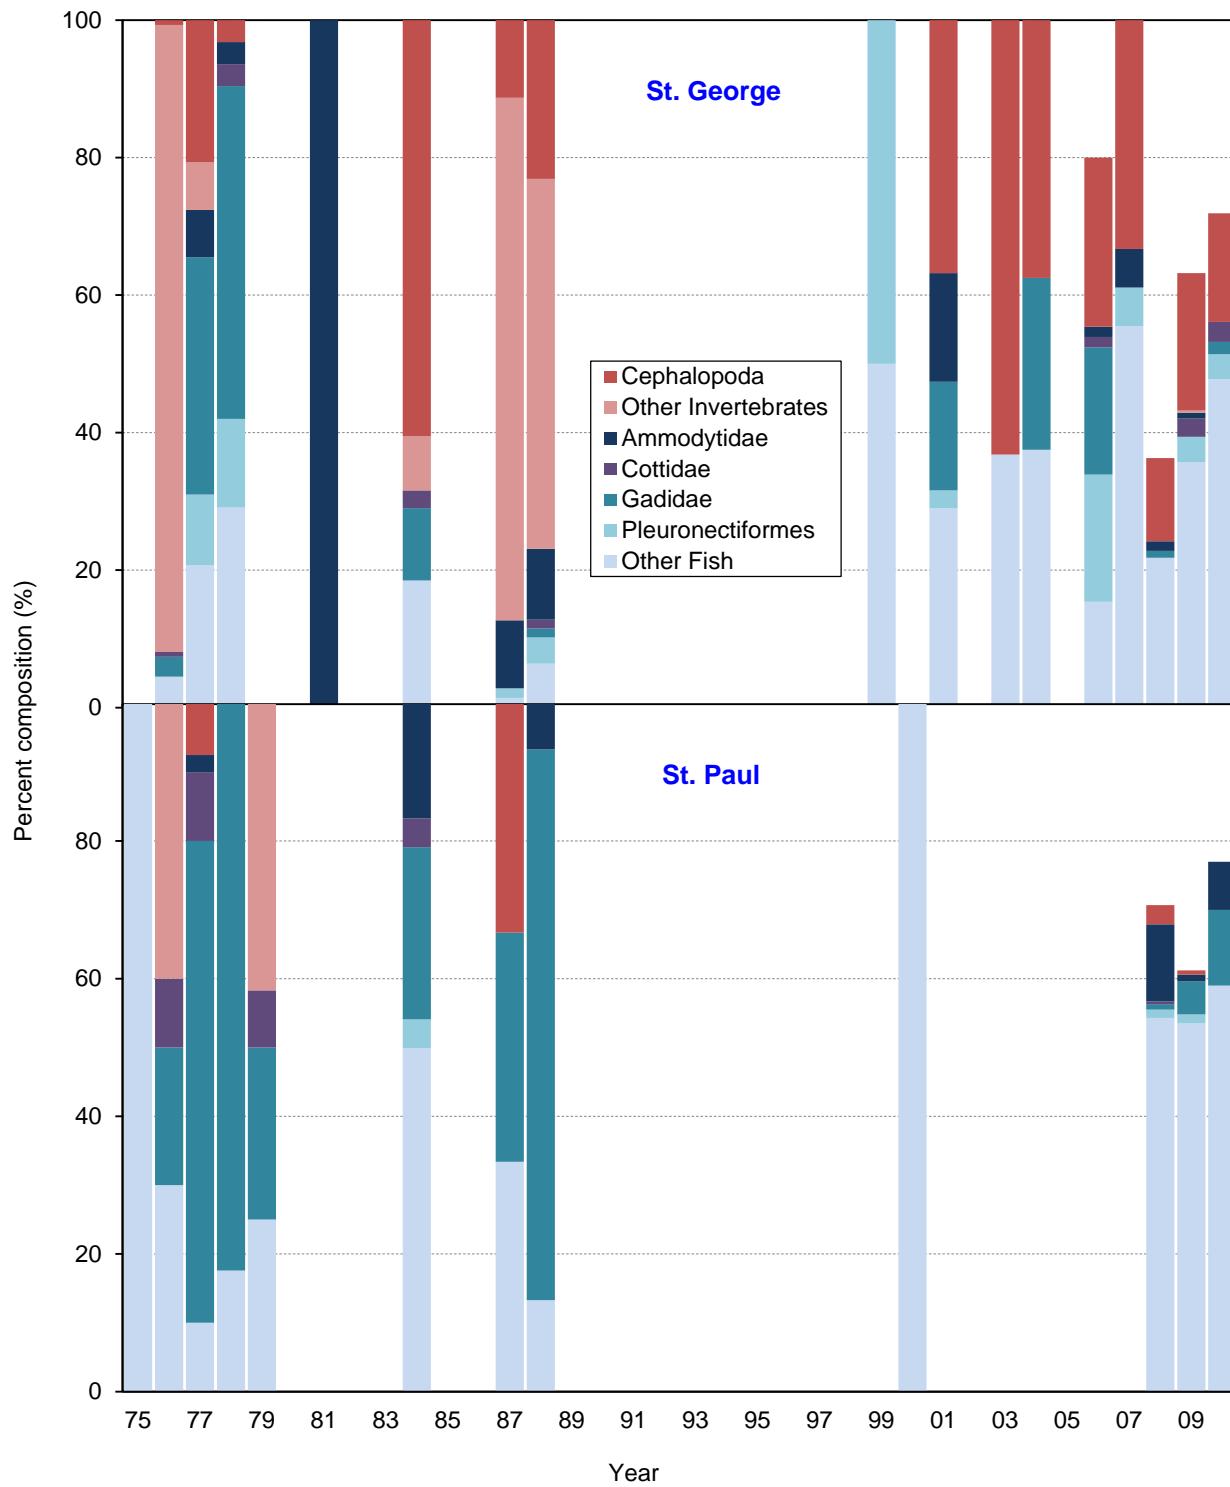

Figure 19. Percent composition of major prey items in diets of thick-billed murre chicks at sites within the Alaska Maritime National Wildlife Refuge. Values are expressed as the percentage of total individual prey items comprised by each prey item. Samples consist of observations of bill loads from adults returning to the colony to feed chicks, collections of bill loads dropped by adults at the colony and regurgitations collected from chicks at the colony ; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; blue = Bering Sea.

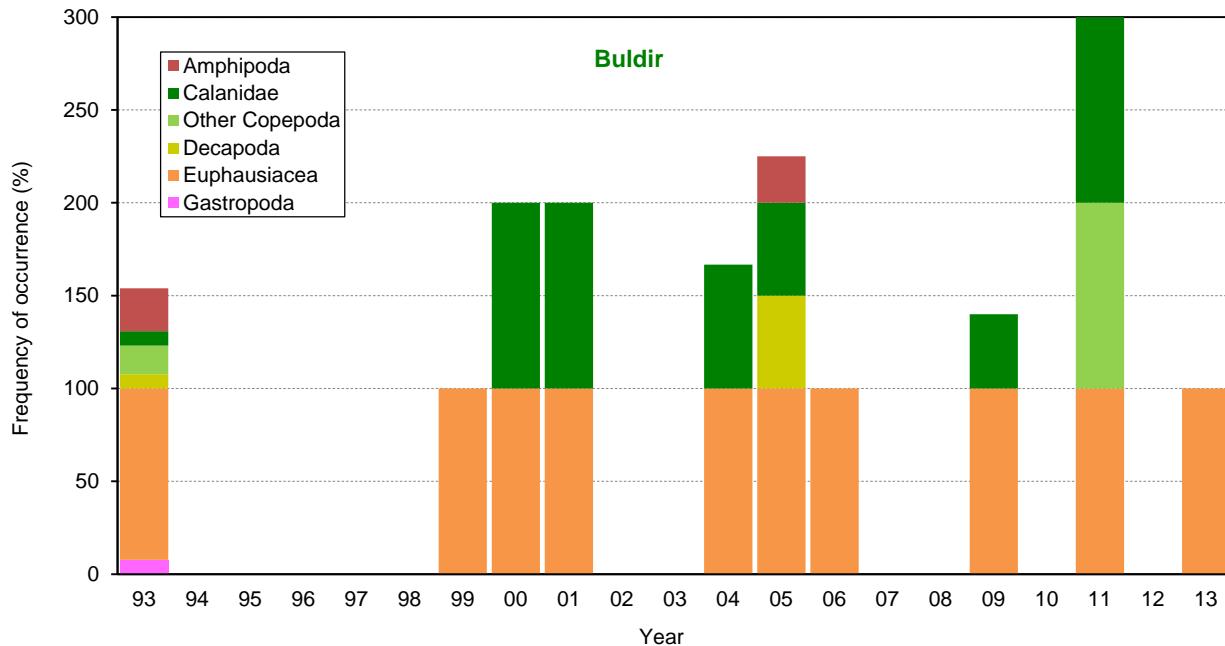

Figure 20. Frequency of occurrence of major prey items in diets of Cassin's auklet chicks at sites within the Alaska Maritime National Wildlife Refuge. Frequency is expressed as the percentage of food samples in which each prey item was present. Samples consist of regurgitations from adults returning to the colony to feed chicks; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; green = Aleutian Islands.

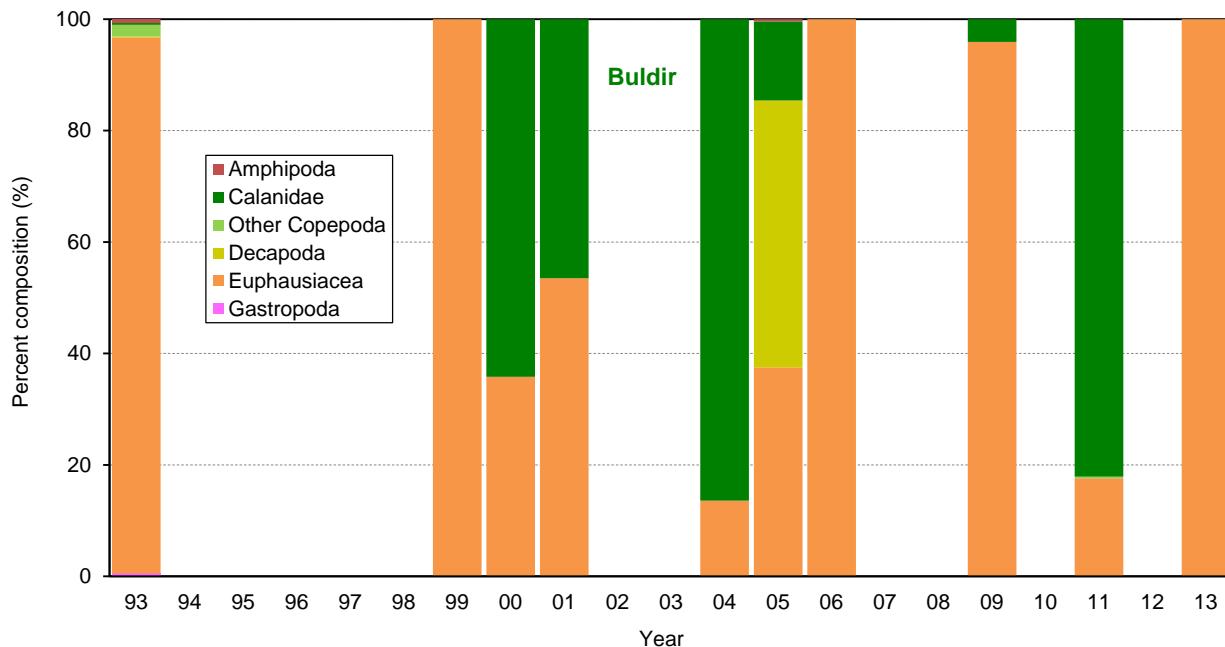

Figure 21. Percent composition of major prey items in diets of Cassin's auklet chicks at sites within the Alaska Maritime National Wildlife Refuge. Values are expressed as the percentage of total individual prey items comprised by each prey item. Samples consist of regurgitations from adults returning to the colony to feed chicks; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; green = Aleutian Islands.

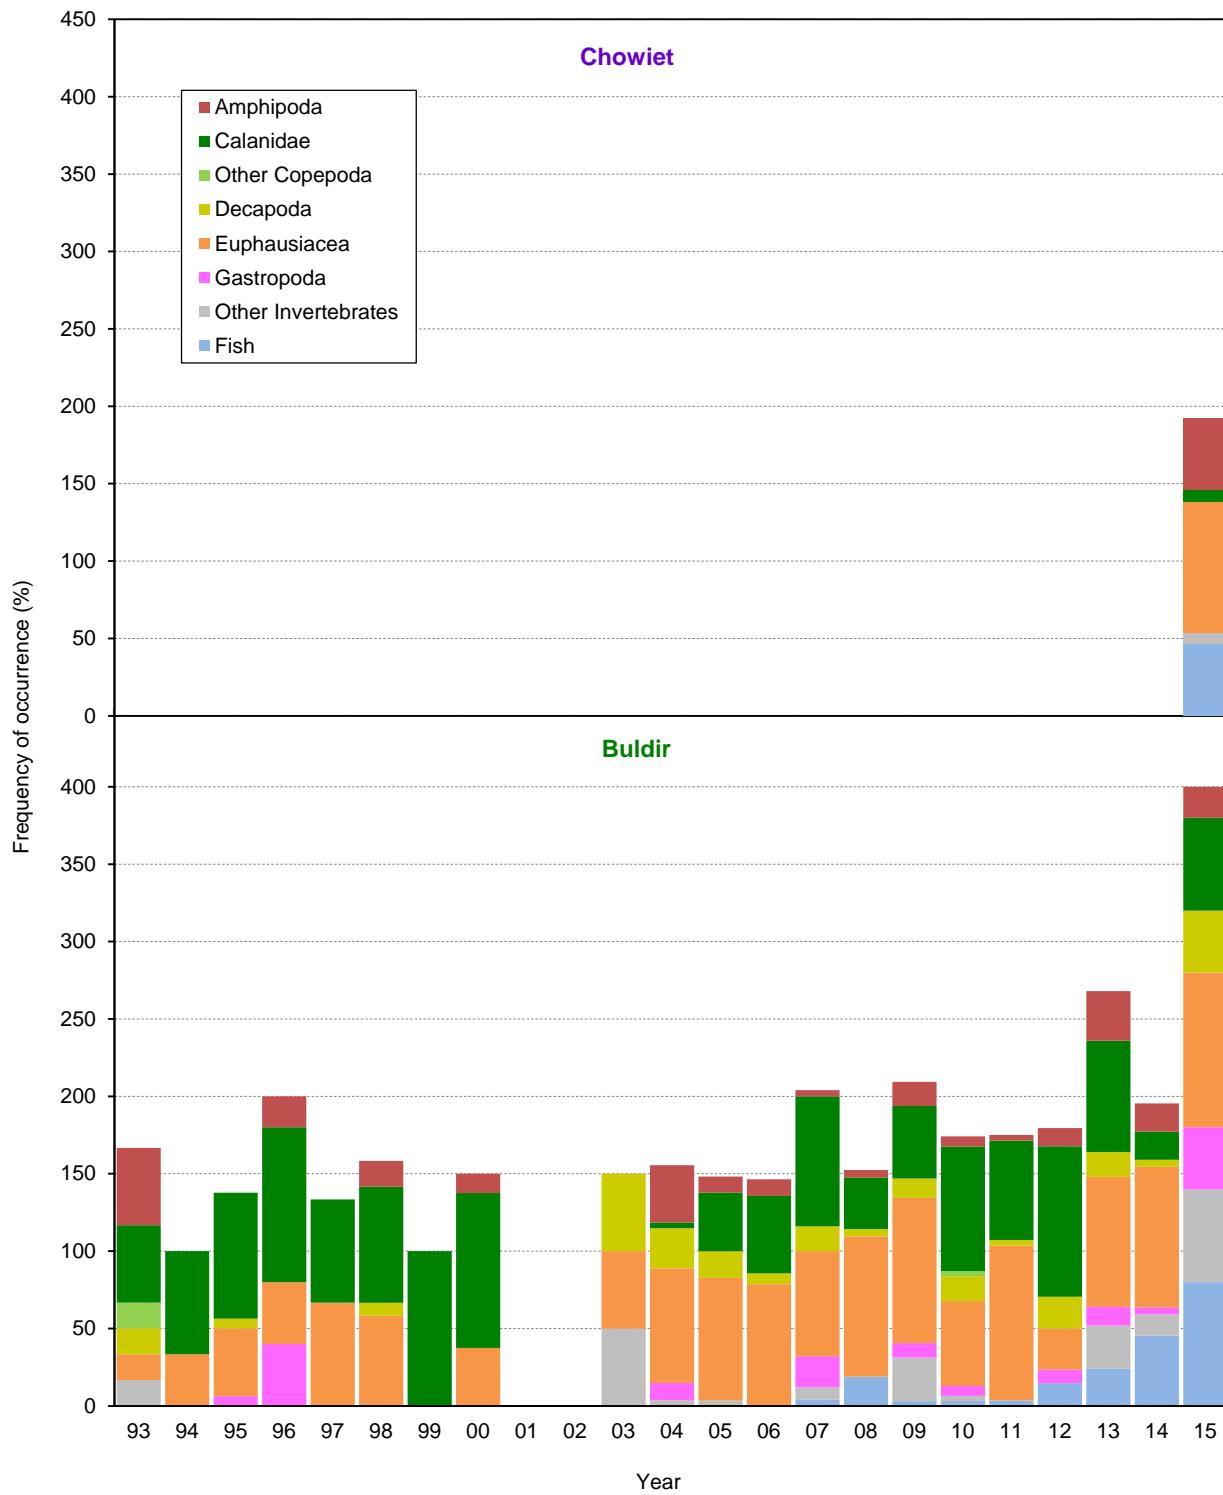

Figure 22. Frequency of occurrence of major prey items in diets of parakeet auklet chicks at sites within the Alaska Maritime National Wildlife Refuge. Frequency is expressed as the percentage of food samples in which each prey item was present. Samples consist of regurgitations from adults returning to the colony to feed chicks; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; purple = Alaska Peninsula, green = Aleutian Islands.

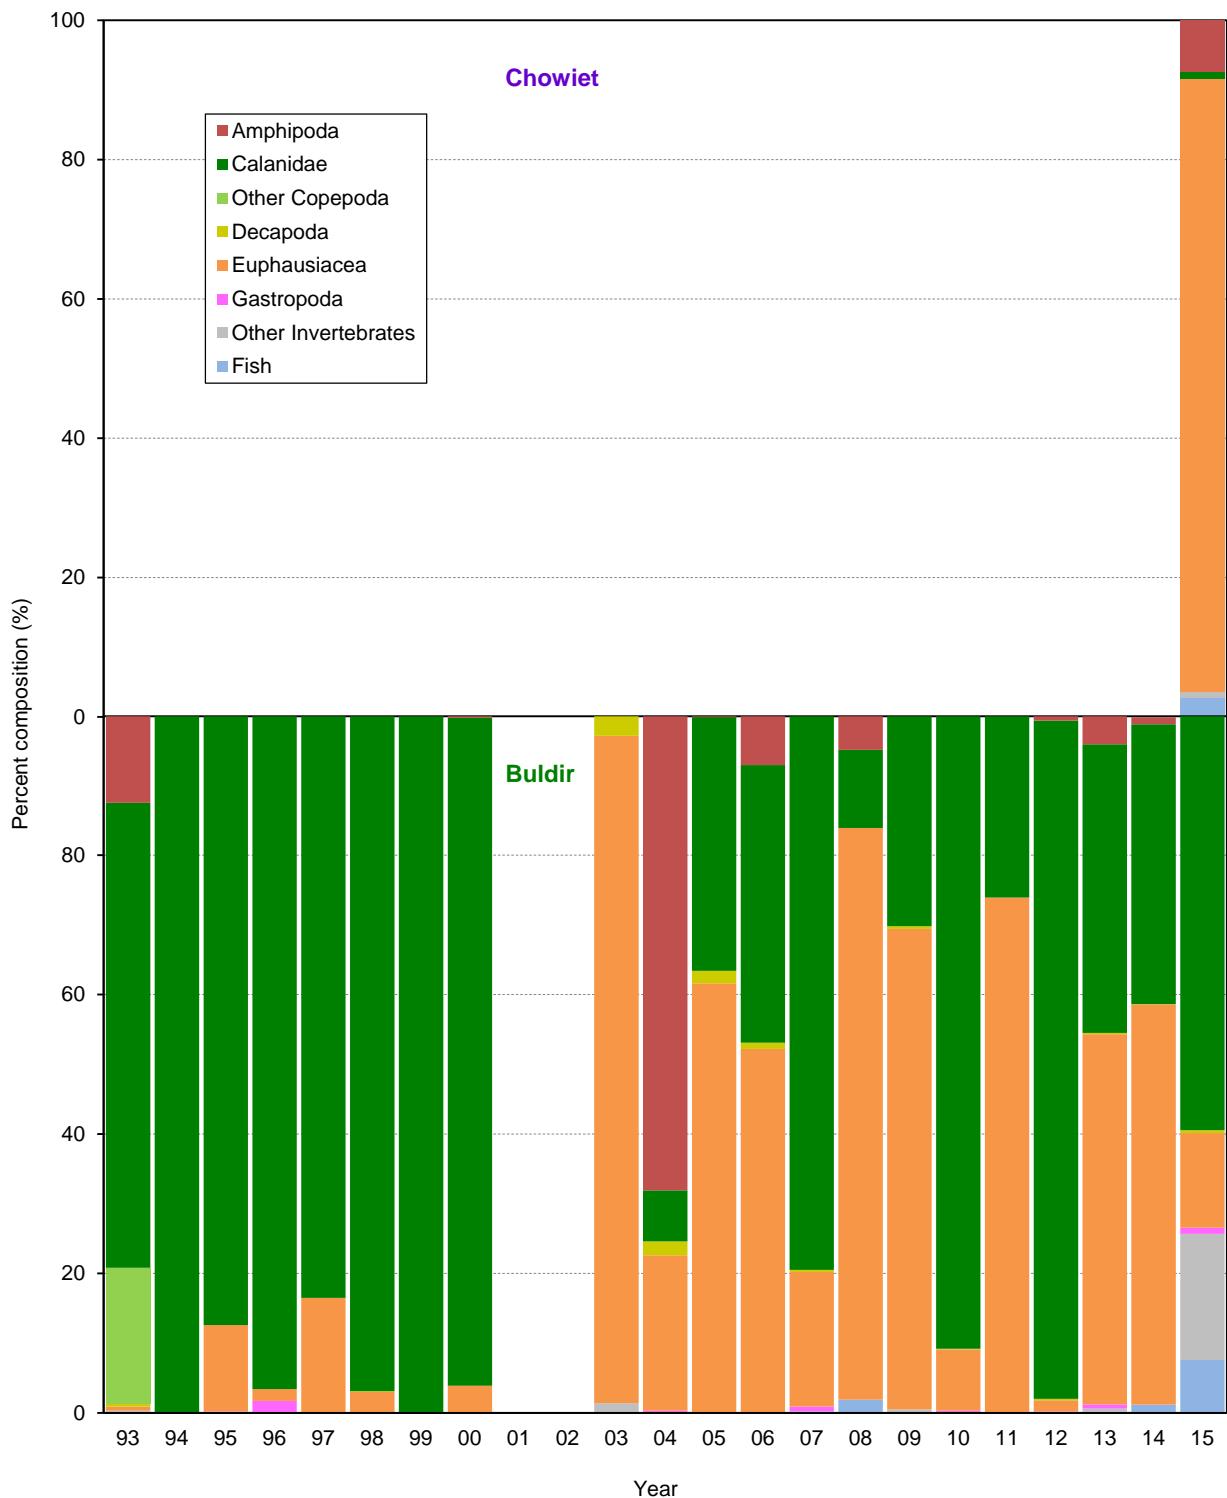

Figure 23. Percent composition of major prey items in diets of parakeet auklet chicks at sites within the Alaska Maritime National Wildlife Refuge. Values are expressed as the percentage of total individual prey items comprised by each prey item. Samples consist of regurgitations from adults returning to the colony to feed chicks; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; purple = Alaska Peninsula, green = Aleutian Islands.

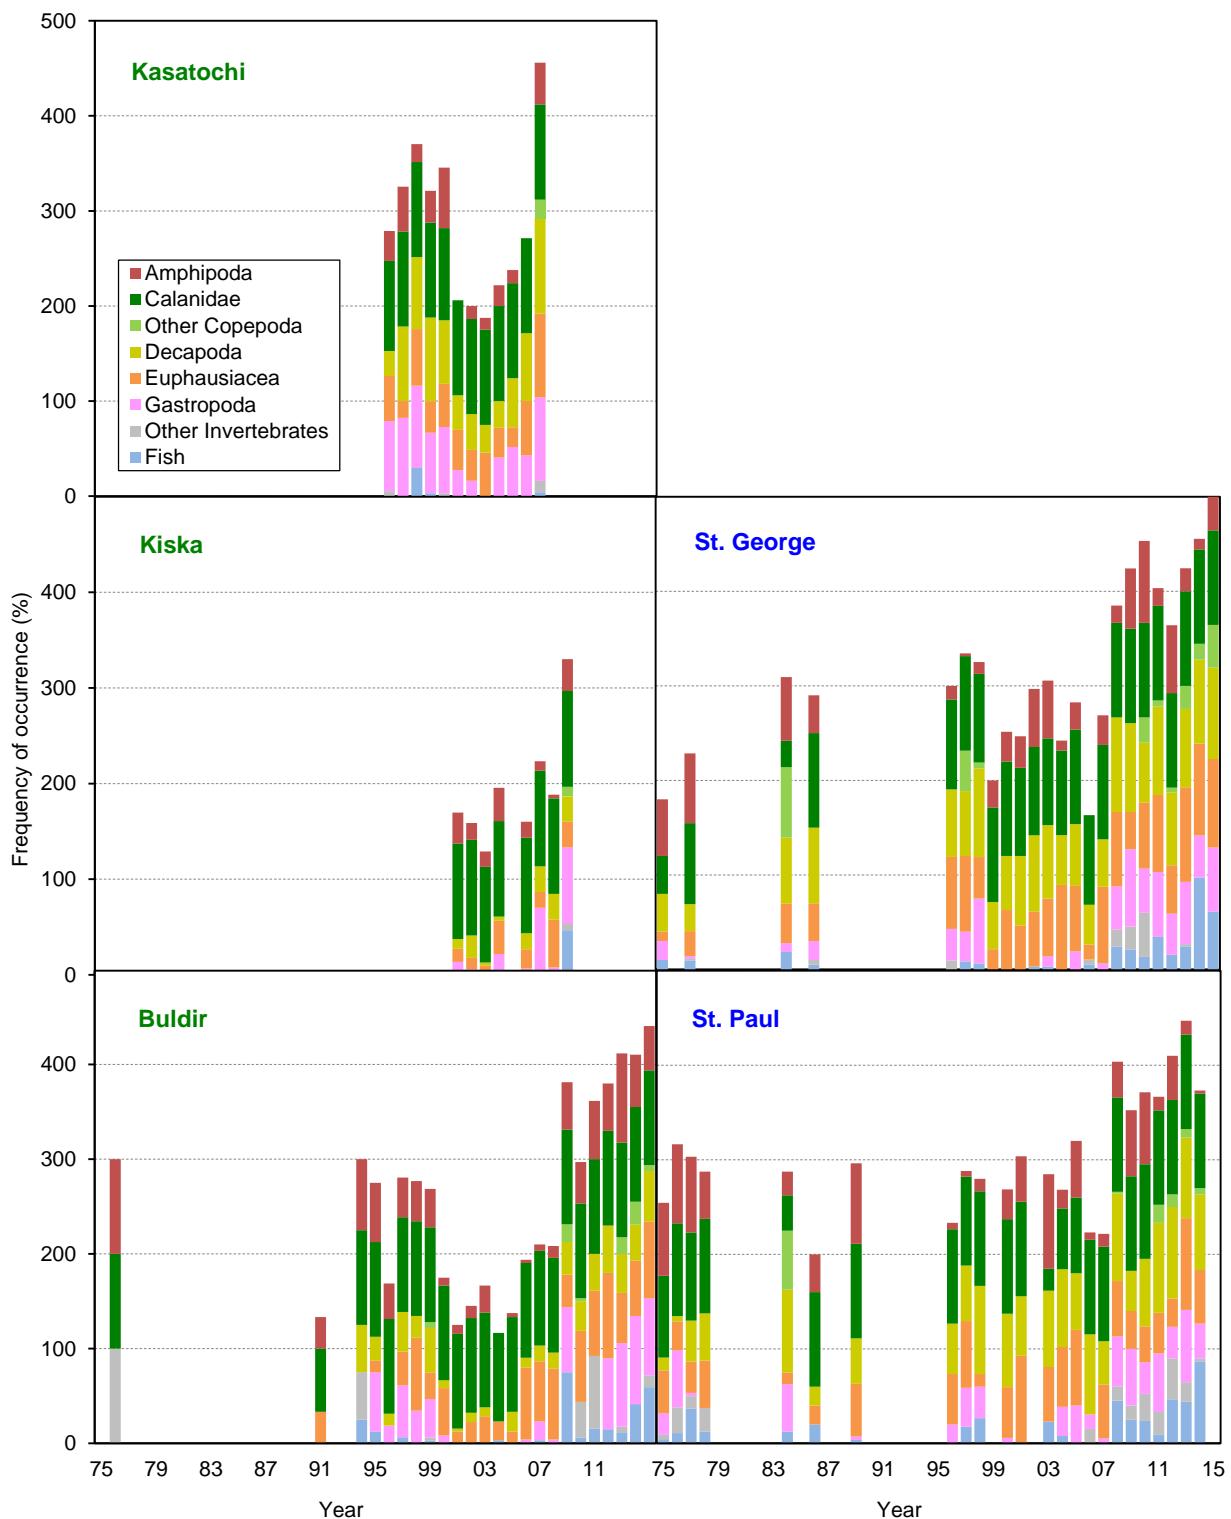

Figure 24. Frequency of occurrence of major prey items in diets of least auklet chicks at sites within the Alaska Maritime National Wildlife Refuge. Frequency is expressed as the percentage of food samples in which each prey item was present. Samples consist of regurgitations from adults returning to the colony to feed chicks; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; green = Aleutian Islands, blue = Bering Sea.

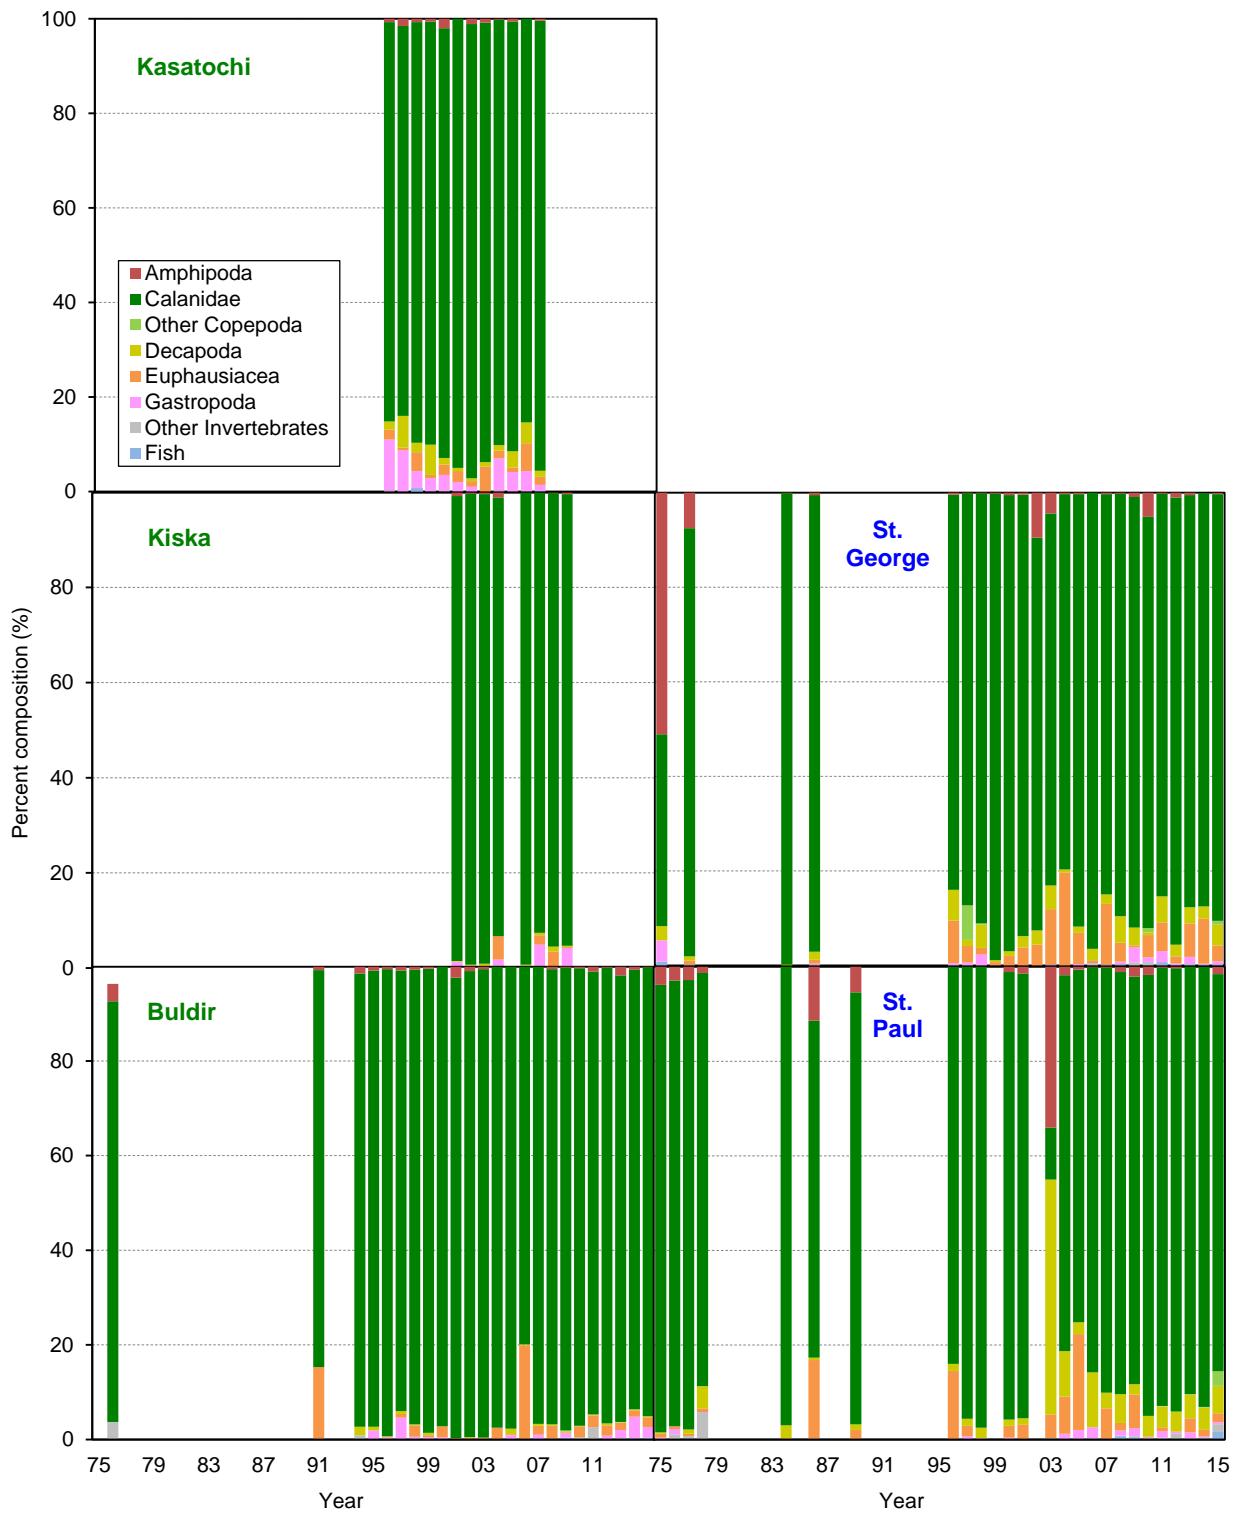

Figure 25. Percent composition of major prey items in diets of least auklet chicks at sites within the Alaska Maritime National Wildlife Refuge. Values are expressed as the percentage of total individual prey items comprised by each prey item. Samples consist of regurgitations from adults returning to the colony to feed chicks; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; green = Aleutian Islands, blue = Bering Sea.

Table 92. Prey items found in diets of least auklet chicks at sites within the Alaska Maritime National Wildlife Refuge. Only sites

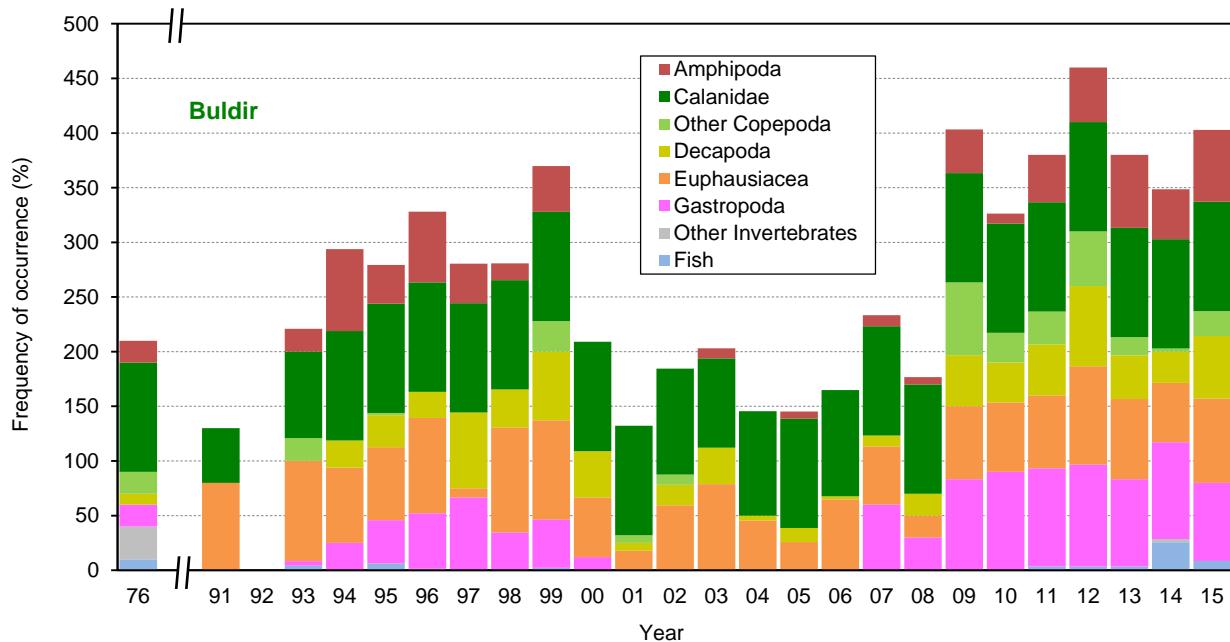

Figure 26. Frequency of occurrence of major prey items in diets of whiskered auklet chicks at sites within the Alaska Maritime National Wildlife Refuge. Frequency is expressed as the percentage of food samples in which each prey item was present. Samples consist of regurgitations from adults returning to the colony to feed chicks; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; green = Aleutian Islands.

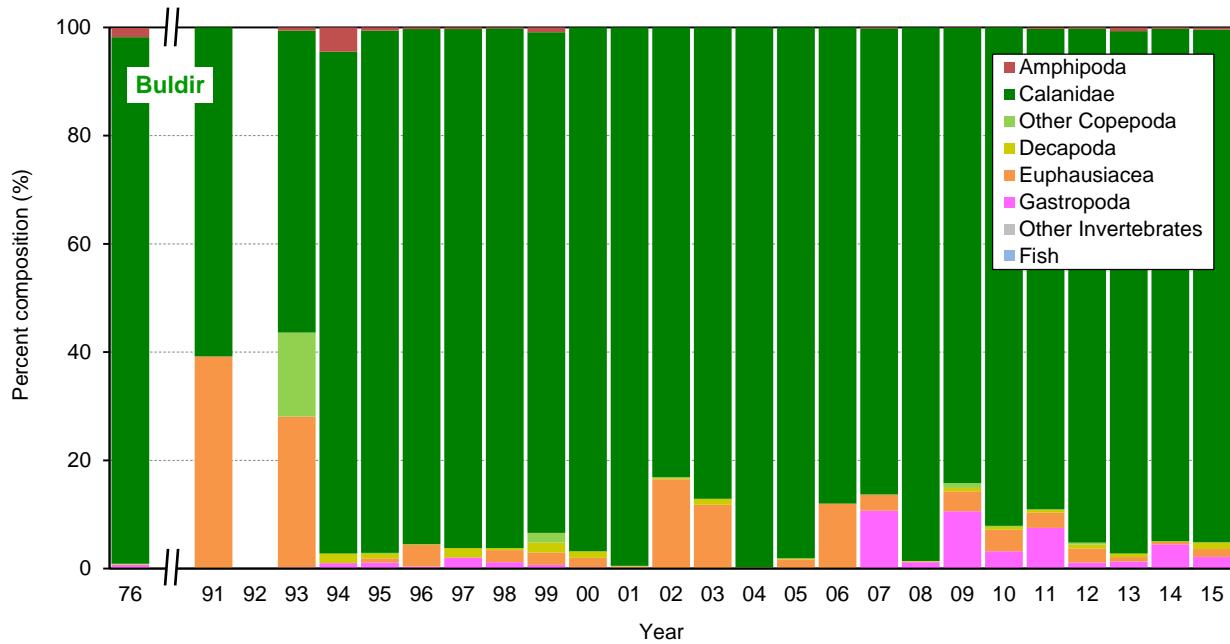

Figure 27. Percent composition of major prey items in diets of whiskered auklet chicks at sites within the Alaska Maritime National Wildlife Refuge. Values are expressed as the percentage of total individual prey items comprised by each prey item. Samples consist of regurgitations from adults returning to the colony to feed chicks; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; green = Aleutian Islands.

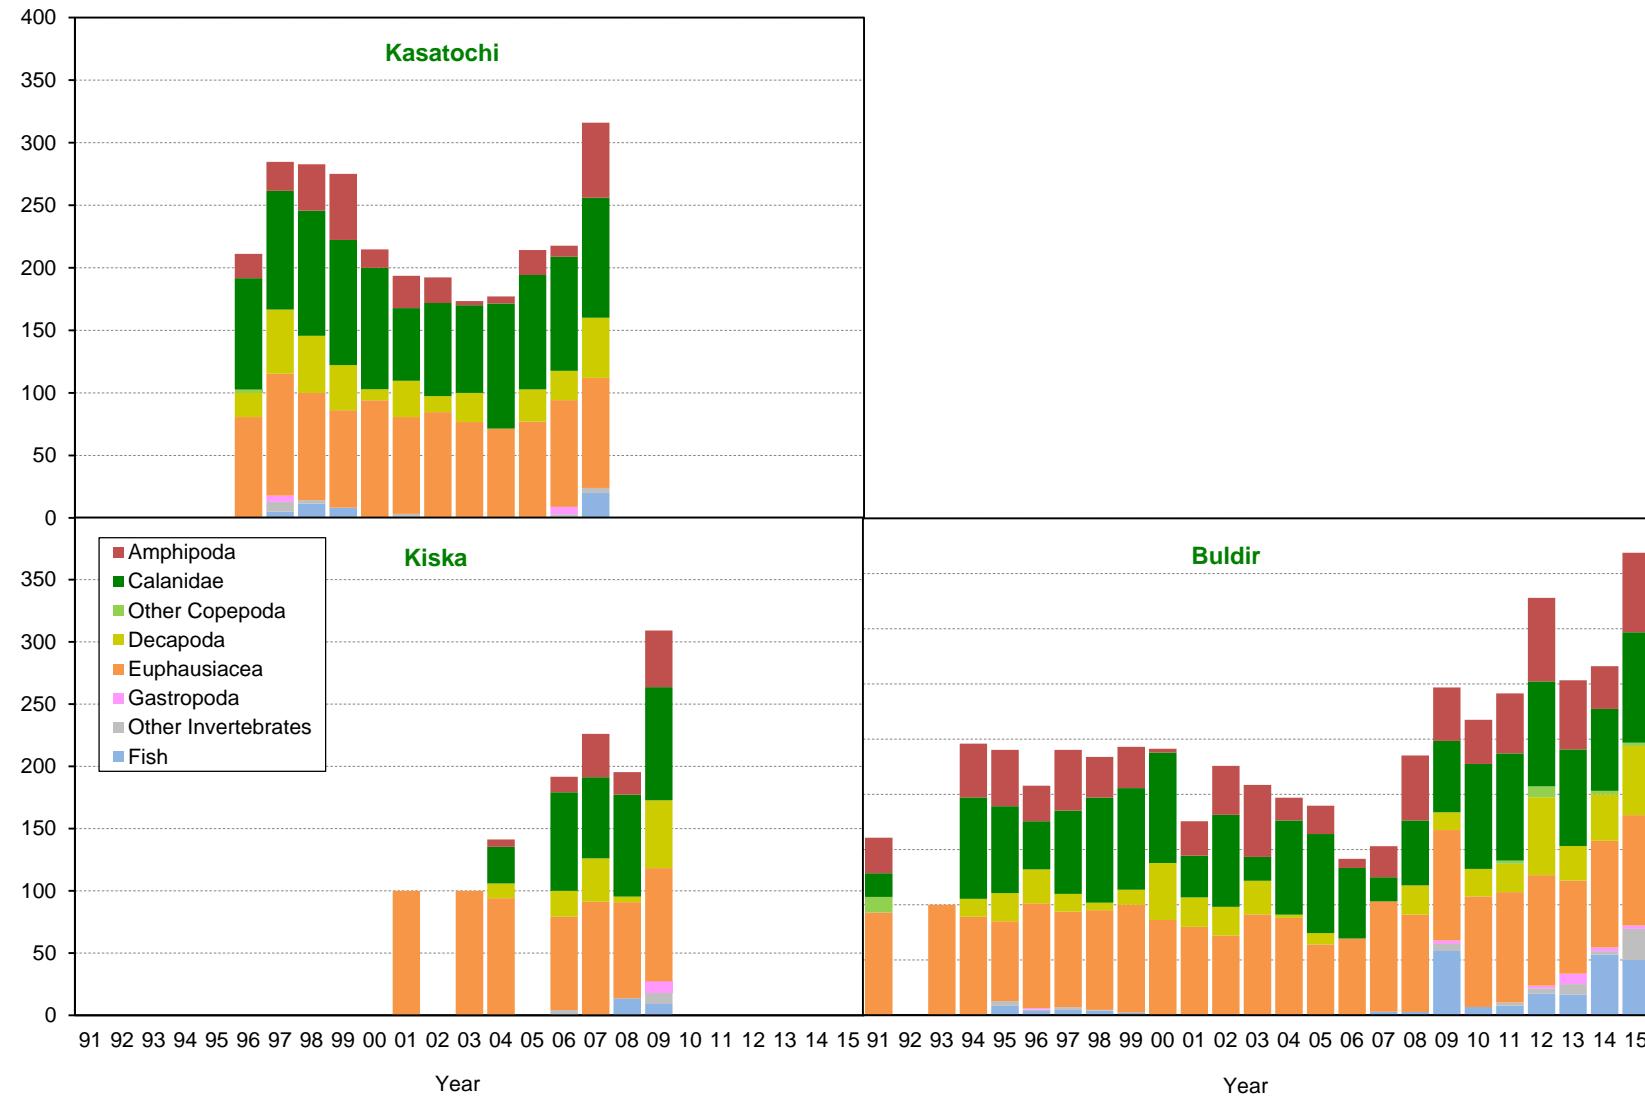

Figure 28. Frequency of occurrence of major prey items in diets of crested auklet chicks at sites within the Alaska Maritime National Wildlife Refuge. Frequency is expressed as the percentage of food samples in which each prey item was present. Samples consist of regurgitations from adults returning to the colony to feed chicks; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; green = Aleutian Islands.

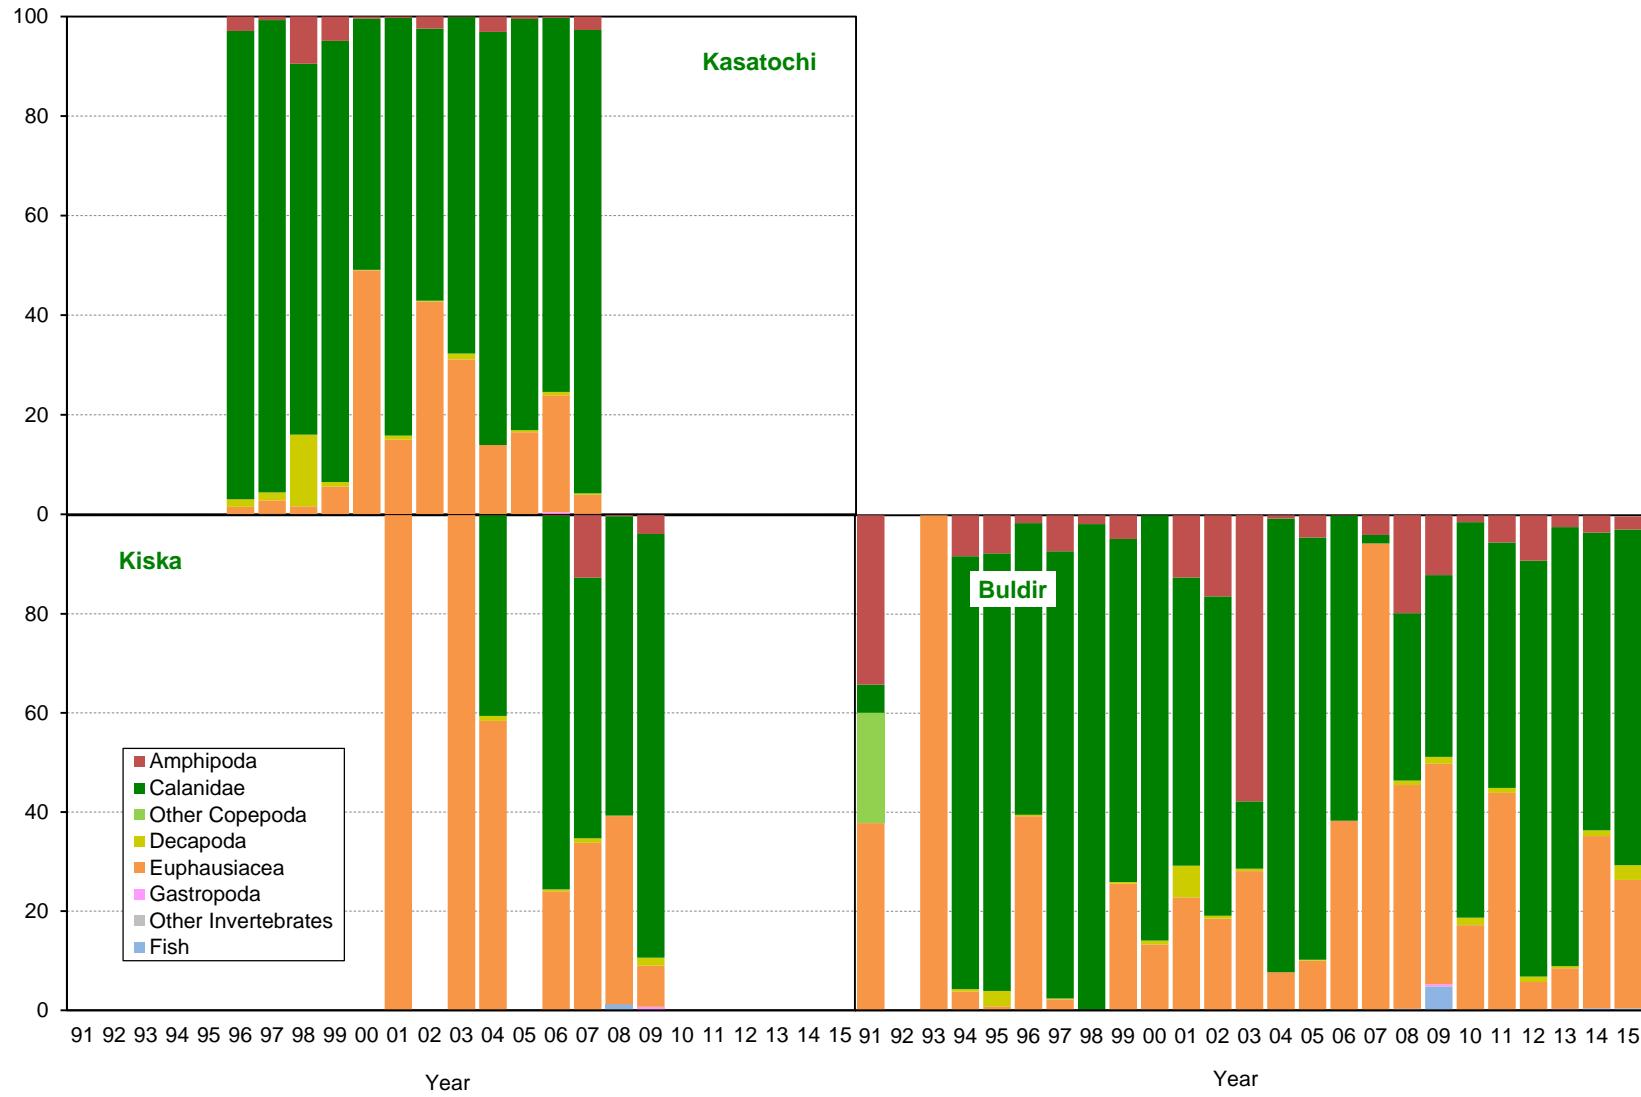

Figure 29. Percent composition of major prey items in diets of crested auklet chicks at sites within the Alaska Maritime National Wildlife Refuge. Values are expressed as the percentage of total individual prey items comprised by each prey item. Samples consist of regurgitations from adults returning to the colony to feed chicks; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; green = Aleutian Islands.

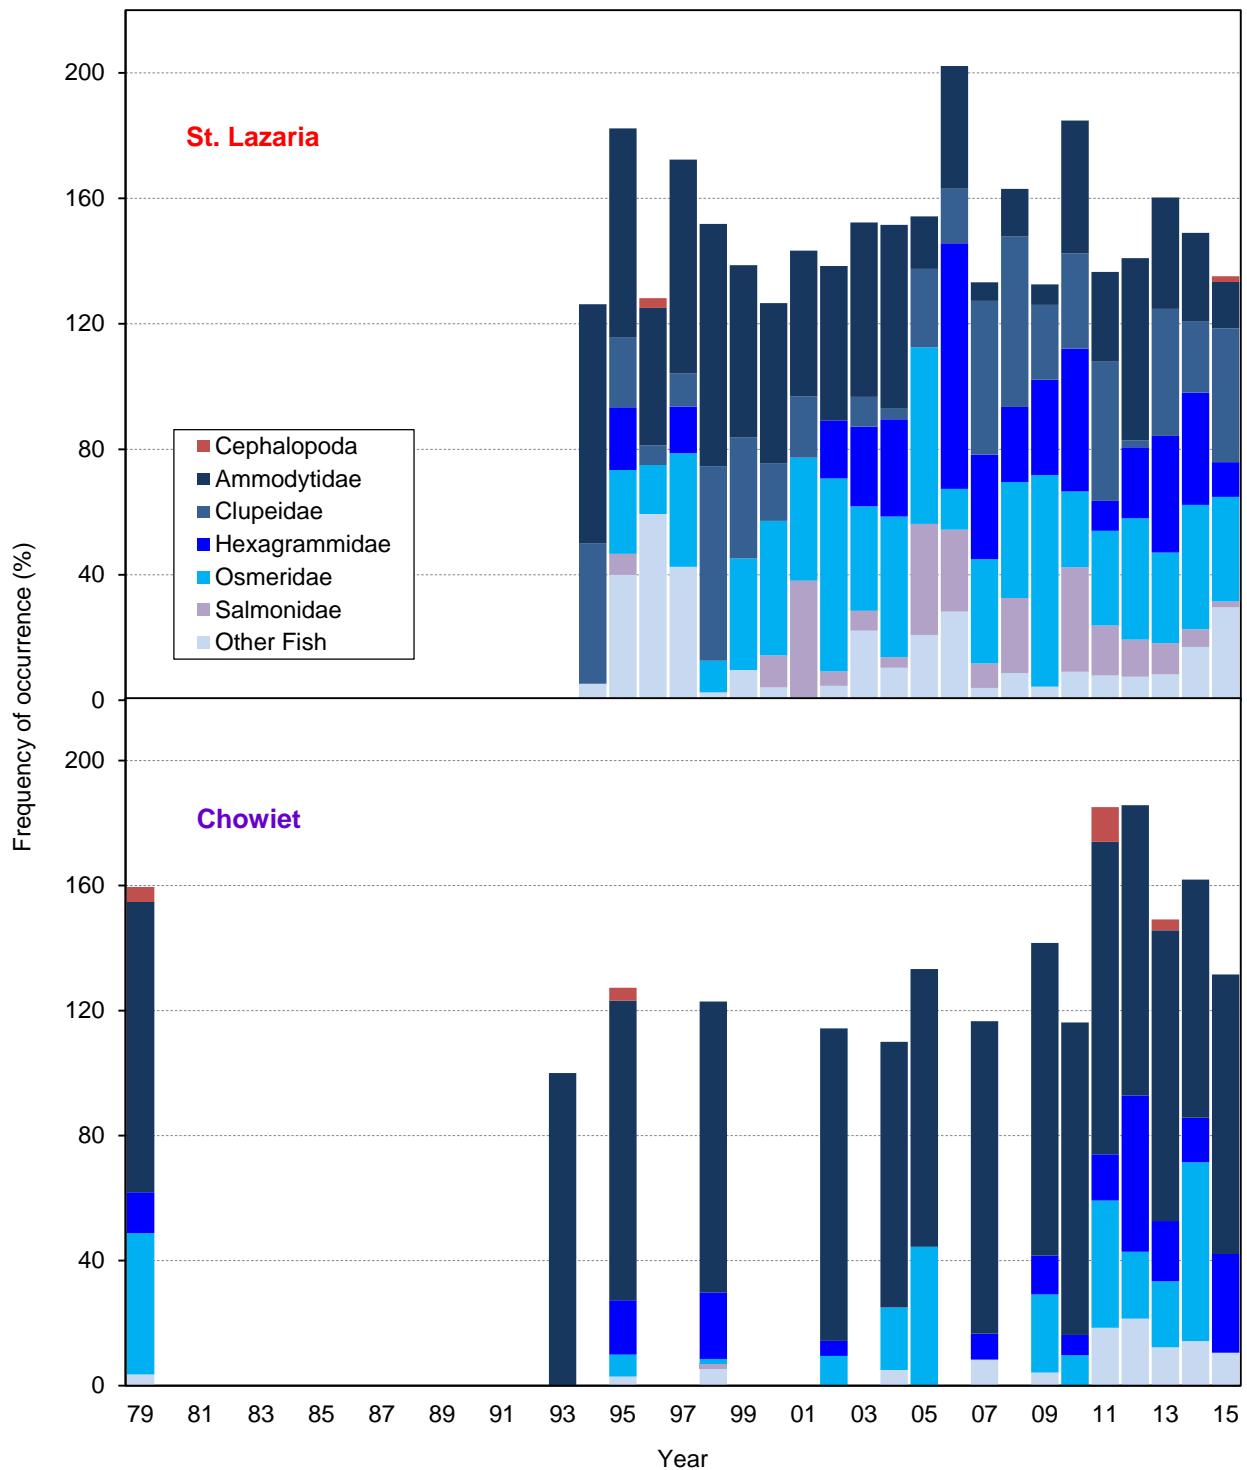

Figure 30. Frequency of occurrence of prey items in diets of rhinoceros auklet chicks at sites within the Alaska Maritime National Wildlife Refuge. Frequency is expressed as the percentage of food samples in which each prey item was present. Samples consist of bill loads collected from adults returning to the colony to feed chicks; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; red = Gulf of Alaska, purple = Alaska Peninsula.

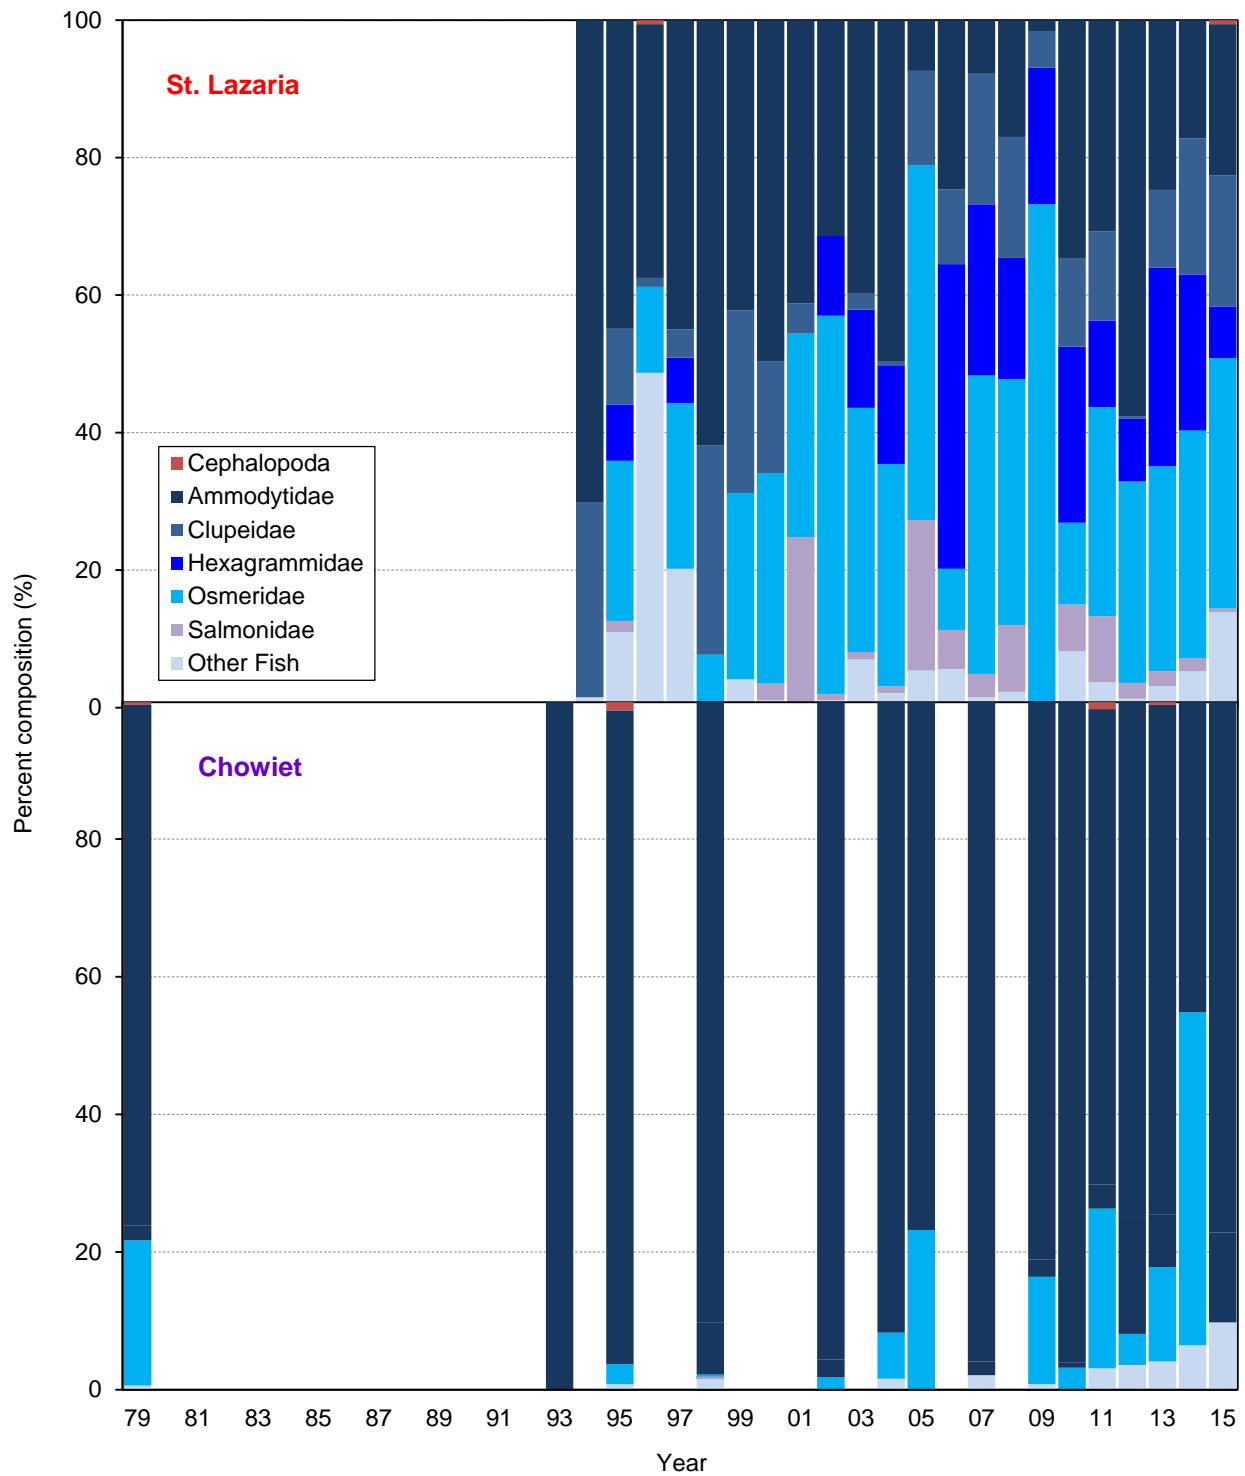

Figure 31. Percent composition of prey items in diets of rhinoceros auklet chicks at sites within the Alaska Maritime National Wildlife Refuge. Values are expressed as the percentage of total individual prey items comprised by each prey item. Samples consist of bill loads collected from adults returning to the colony to feed chicks; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; red = Gulf of Alaska, purple = Alaska Peninsula.

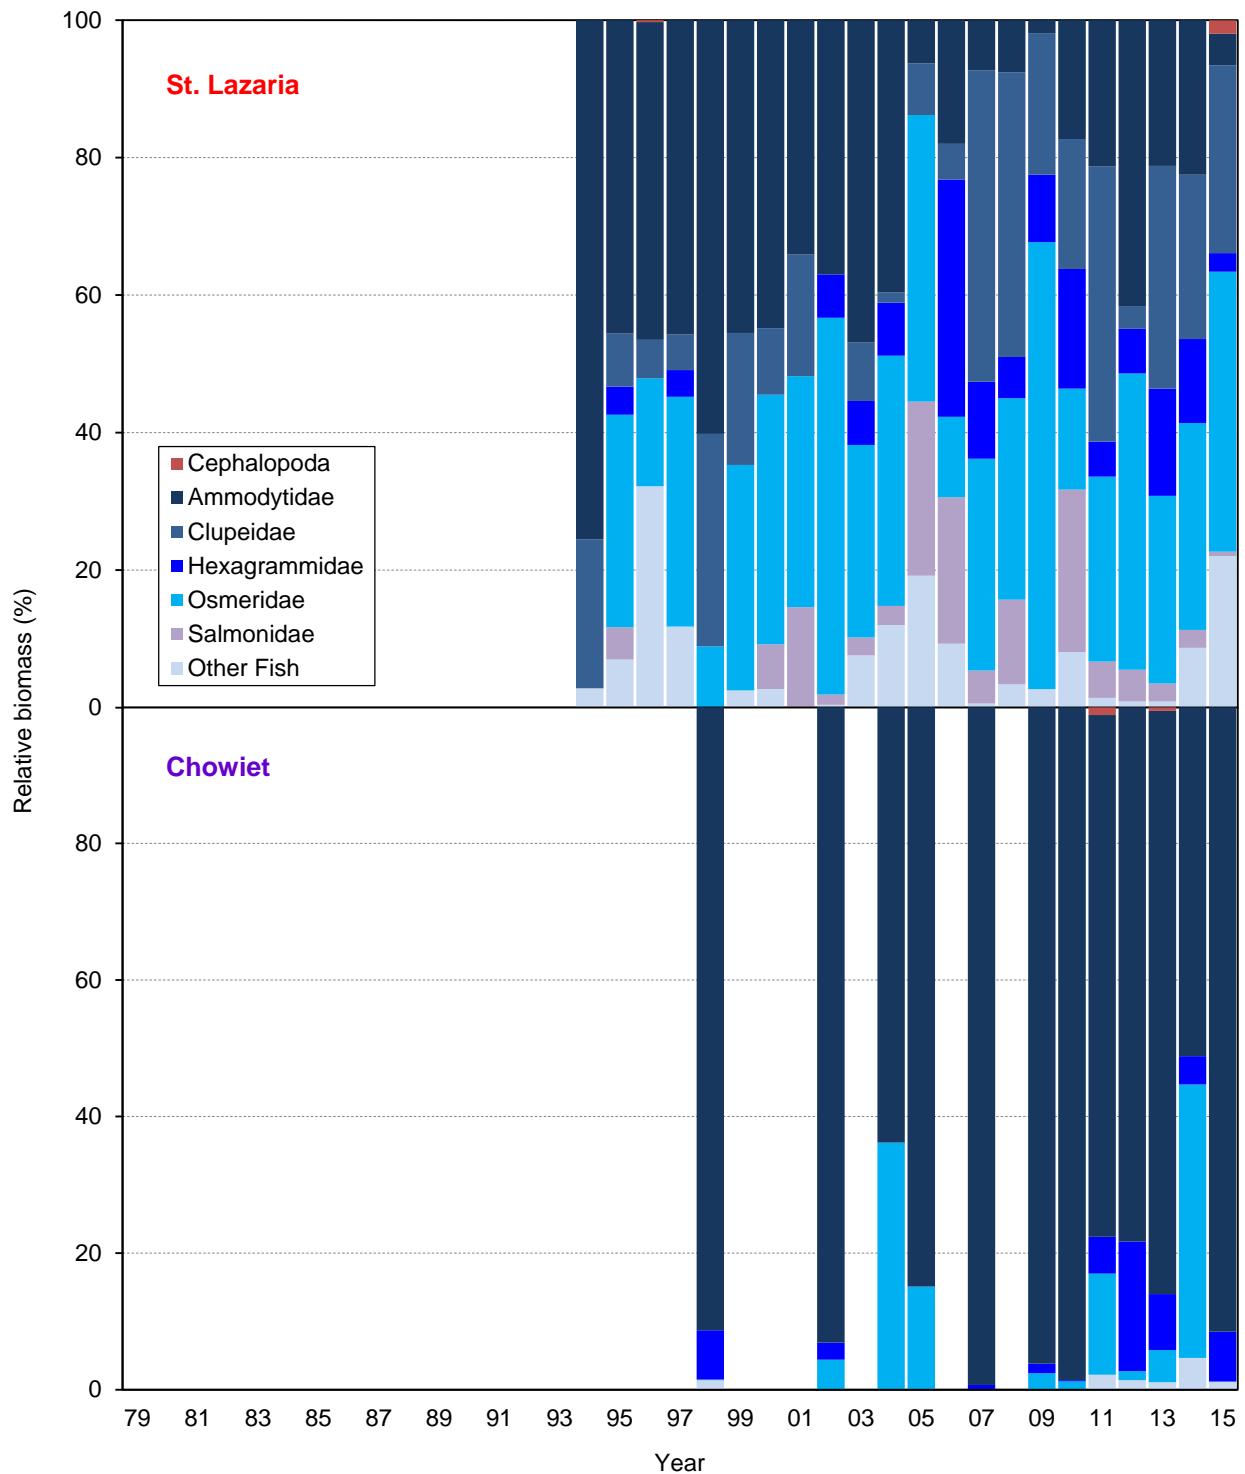

Figure 32. Relative biomass of prey items in diets of rhinoceros auklet chicks at sites within the Alaska Maritime National Wildlife Refuge. Numbers represent the percentage of the mass of combined food samples comprised by each prey item. Samples consist of bill loads collected from adults returning to the colony to feed chicks; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; red = Gulf of Alaska, purple = Alaska Peninsula.

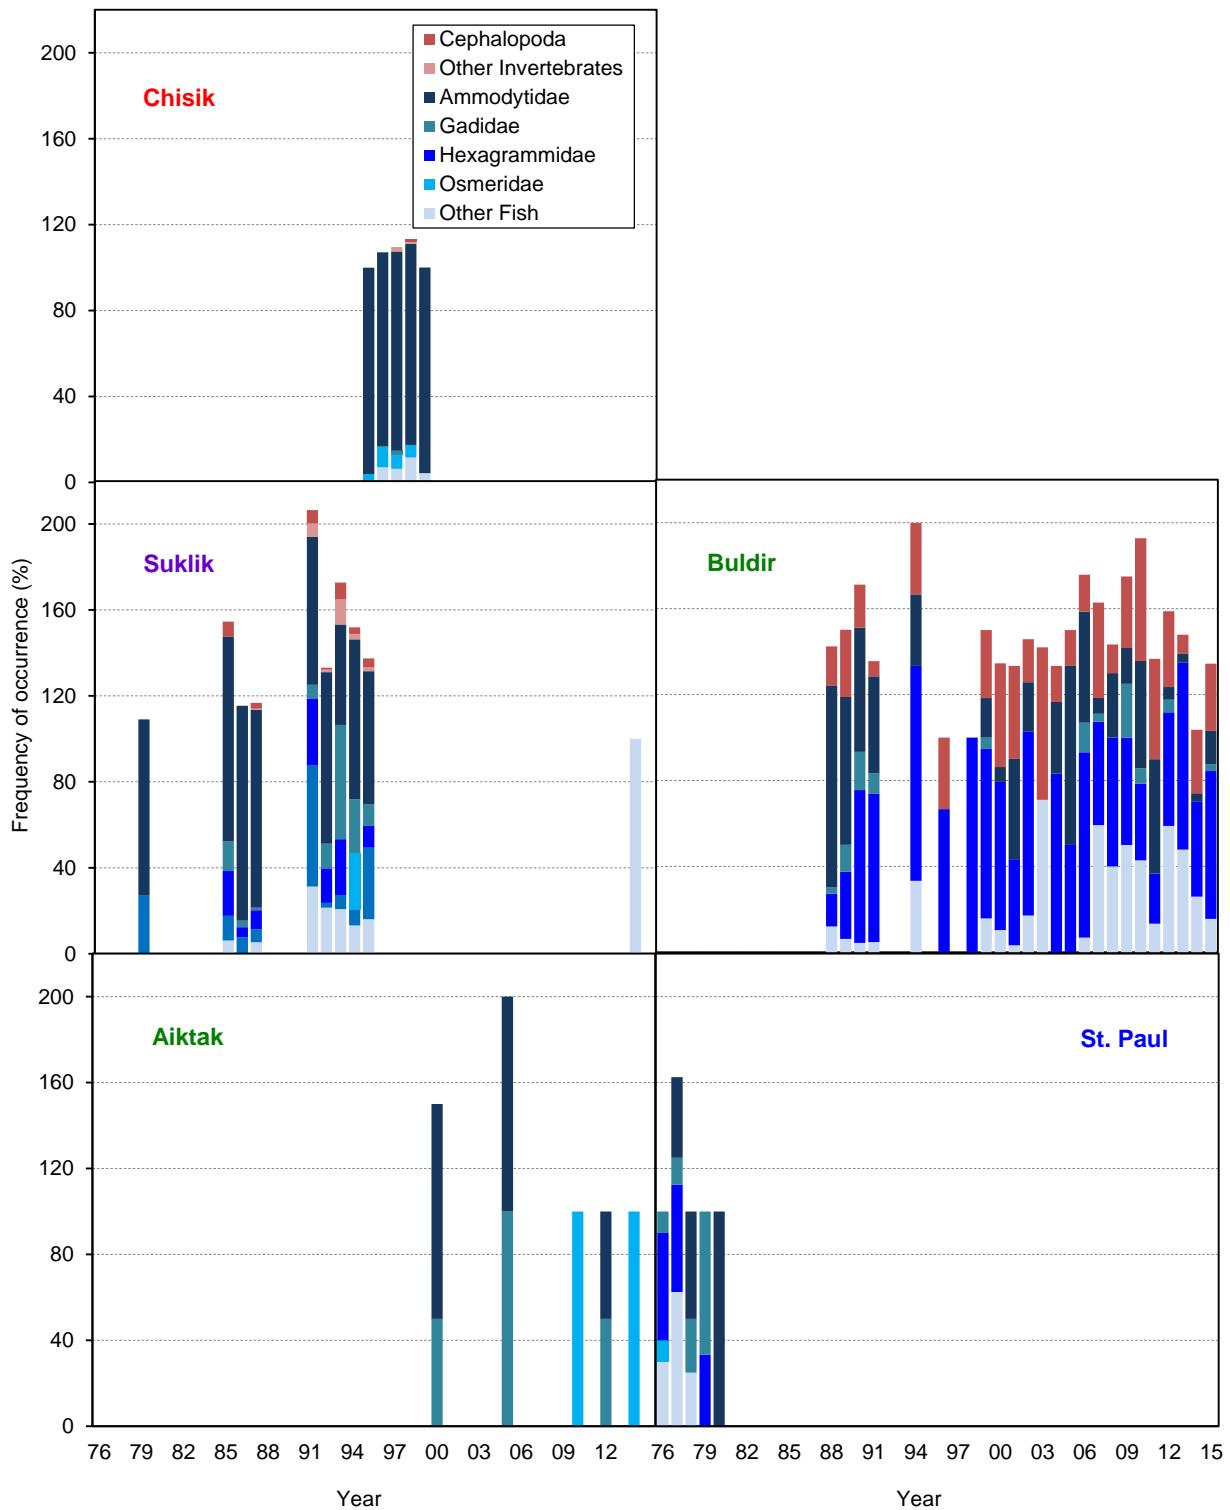

Figure 33. Frequency of occurrence of major prey items in diets of horned puffin chicks at sites within the Alaska Maritime National Wildlife Refuge. Frequency is expressed as the percentage of food samples in which each prey item was present. Samples consist of bill loads collected from adults returning to the colony to feed chicks; see tables for sampling specifics per site and year and more detailed diet information. Only sites with ≥ 5 years of data or ongoing diet sampling are shown. Colors in island name indicate geographic units; red = Gulf of Alaska, purple = Alaska Peninsula, green = Aleutian Islands, blue = Bering Sea.

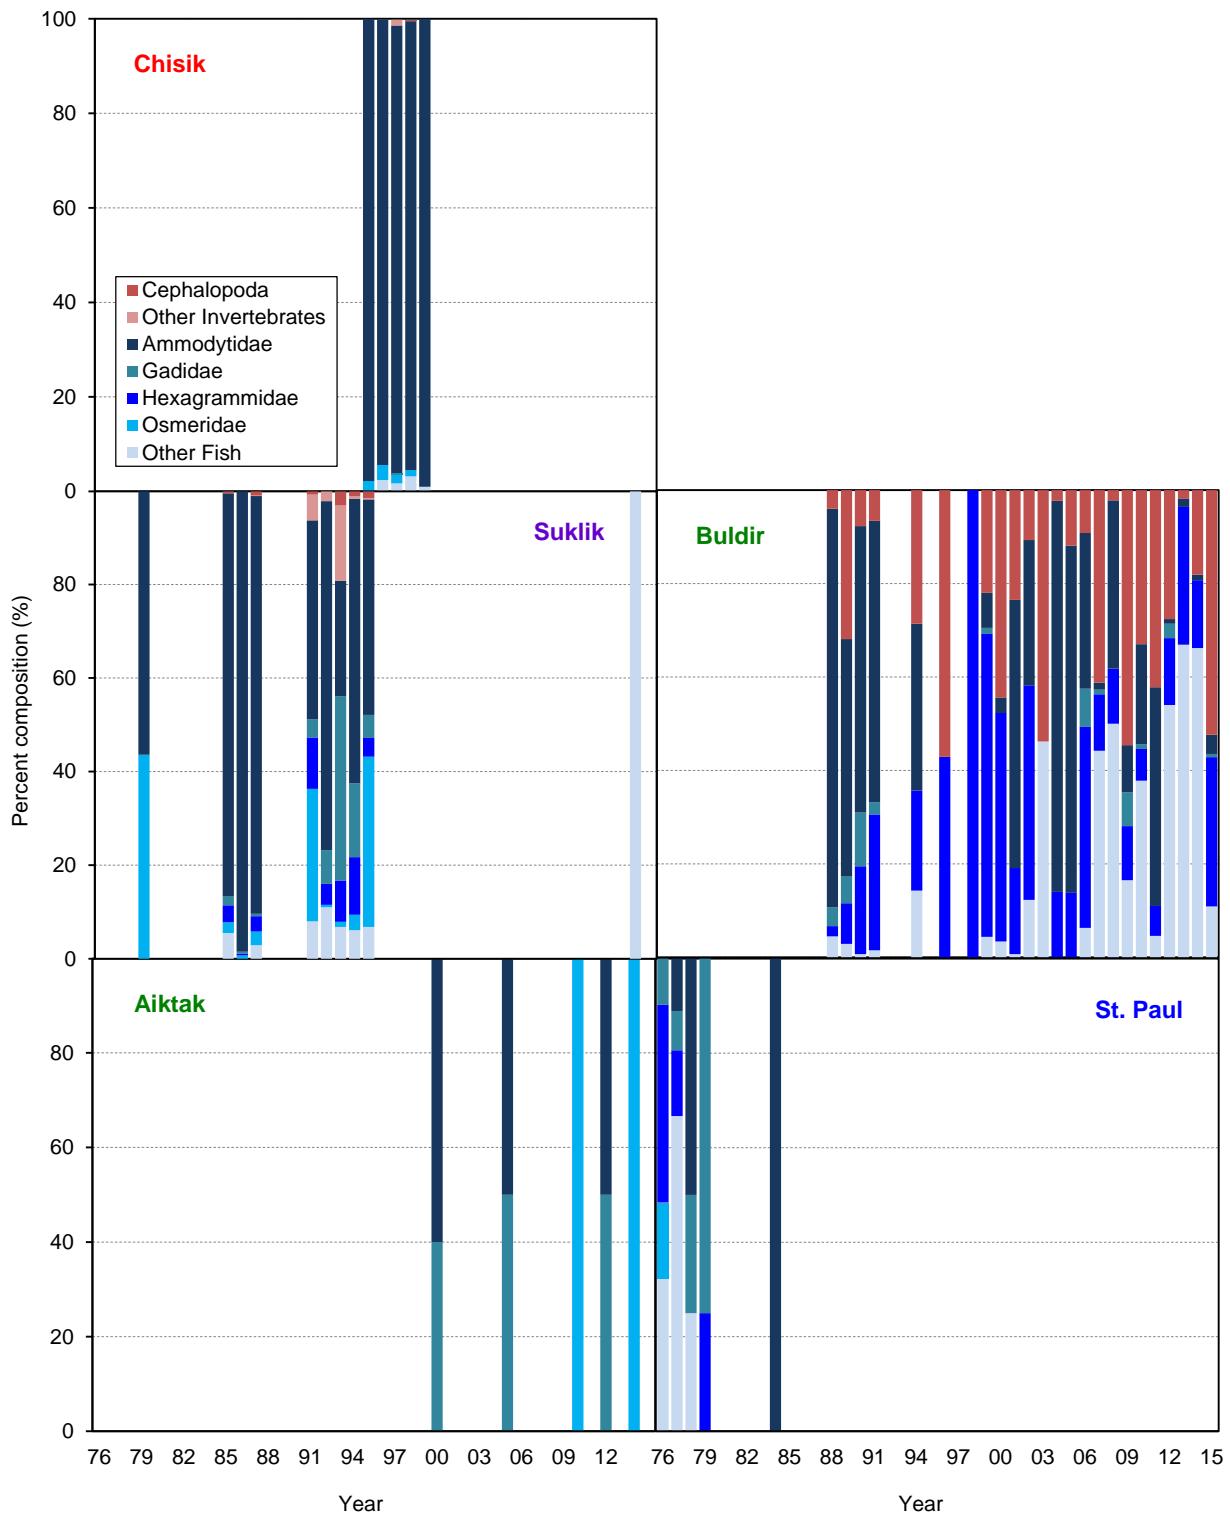

Figure 34. Percent composition of major prey items in diets of horned puffin chicks at sites within the Alaska Maritime National Wildlife Refuge.
