INTRODUCTION

The Alaska Maritime National Wildlife Refuge (AMNWR) conducts annual ecological monitoring at nine sites throughout Alaska. The objective of this long-term monitoring program is to collect baseline status and trend information for a suite of seabird species representing piscivorous and planktivorous trophic guilds, including key species that serve as indicators of ecosystem health. Members of these guilds include surface feeders and divers feeding in both nearshore and offshore waters. By relating data to environmental conditions and information from other sites, ecosystem processes may be better understood. Data also provide a basis for directing management and research actions, and in assessing effects of management.

St. Paul Island, in the Pribilof Islands in the southeastern Bering Sea, has been an annual monitoring site since 1985. Between 1975 and 1984, the Minerals Management Service (MMS) funded studies to monitor trends in populations and productivity of ledge-nesting seabirds in the Pribilof Islands due to concerns over potential offshore oil development along the continental shelf (Hickey and Craighead 1977, Hunt et al. 1981, Craighead and Oppenheim 1985, Lloyd 1985, Johnson and Baker 1985, Troy and Baker 1985). The U.S. Fish and Wildlife Service purchased most of the seabird nesting areas in the Pribilof Islands between 1982 and 1985. Annual monitoring by AMNWR has occurred in most years since 1985 (Byrd et al. 1985; Byrd 1986, 1987, 1989; Dragoo et al. 1989; Wagner 1989; Fairchild 1991; Climo 1993, 1997; Carten and Calvin 1997; Carten and Sommer 1998; Bittner and Farence 1999; Bittner 2001; Snorek 2001; Howard 2002; Polito and Drew 2003; Wright and Will 2004; Thomson 2006; Thomson and Sapora 2007; Wright et al. 2007; Thomson and Spitler 2008; McClintock et al. 2010; Drummond et al. 2011; Thomson and Drummond 2011, 2012; Thomson and Romano 2013; Thomson et al. 2014, 2015; Mong and Romano 2016).

The specific monitoring goals in 2017 were to estimate productivity and population parameters for five indicator species representing two major feeding guilds: 1) diving fish-feeders (red-faced cormorants [*Phalacrocorax urile*] and common and thick-billed murres [*Uria aalge* and *U. lomvia*], and 2) surface fish-feeders (black-legged and red-legged kittiwakes [*Rissa tridactyla* and *R. brevirostris*]). Additional monitoring goals include the description of breeding chronology, food habits, chick growth, and adult survival for one or more of the above species, as well as food habits data for least auklets (diving plankton feeders; *Aethia pusilla*).

Detailed results of the 2017 monitoring program are contained in the figures and tables of this report and archived at the AMNWR headquarters in Homer, Alaska. Summary data will also be included in the annual Alaska seabird monitoring summary report (e.g., Dragoo et al. 2017). Due to occasional reanalysis of some data, correction of typographical errors, and efforts to standardize presentation across sites, some values used in this report have changed from previous versions. The values presented here are considered the cleanest data set available at the time this report was issued and should supersede previous reports.

STUDY AREA

St. Paul Island ($57^{\circ}10'N$, $170^{\circ}15'W$) is located in the Pribilof Islands in the southeastern Bering Sea, Alaska (see Figures 1 and 2). Volcanic in origin, the island lies near the outer edge of the continental shelf that runs between Alaska and Russia. Water exchange between the Bering Sea and North Pacific Ocean forms a zone of upwellings and ocean fronts around the continental shelf that is rich in nutrients. These conditions create some of the highest primary productivity rates in the world's oceans (Lewbel

1983), which in turn support one of the highest densities of seabirds on earth (Hood 1981). About 90 km from the other major Pribilof island of St. George, St. Paul is farther north, a greater distance from the highly-productive shelf break region and closer to the maximum extent of winter pack ice.

Cliffs span approximately 11 km of St. Paul's coastline and reach up to 115 m high, providing breeding habitat to an estimated 250,000 seabirds (Sowls et al. 1978). In addition, St. Paul Island is one of just a few sites where red-legged kittiwakes nest (Byrd and Williams 1993).

METHODS

Personnel: The U.S. Fish and Wildlife Service field crew at St. Paul Island in 2017 consisted of Ryan Mong (21 May to 3 September), Brady Deal (21 May to 25 August), and Sarah Gilman (9 July to 3 August).

Data Collection and Analysis: Crew members followed data collection and analysis methods outlined in the annual monitoring camp standardized protocols for 2017 (Alaska Maritime National Wildlife Refuge 2017). Monitoring plots for kittiwakes, murres, and red-faced cormorants were visited for productivity and chronology every three to five days from pre-laying until fledging, beginning on 22 May and continuing until 2 September. Diet samples were collected from least auklets captured via mist net, as well as red-faced cormorant chicks captured for banding purposes. In addition to the seabird work described above, the monitoring crew compiled a species account of all birds and marine mammals seen in 2017.

Reproductive success and chronology data for kittiwakes and murres were summarized using the AMNWR productivity database (historical data for a few years are not summarized by the database because raw nest observation data were not available [1975-1988 and 1993-1995, depending on the species; see Appendices B-E]). Reproductive success and chronology data for cormorants were summarized by hand. A new productivity plot, 116, was added to the east side of Zapadni in 2017 primarily to monitor red-faced cormorant productivity.

Population data for all ledgenester species was collected in 2017. Tufted and horned puffin population counts were also conducted within the refuge's long term population monitoring plots. Data on puffin attendance has not been collected in the past but was included in 2017 due to the die-off that occurred in 2016. Data collected on all species in both 2014 and 2017 were summarized using the AMNWR population database; population data for ledgenesters in 1975-2011 and all other species in all years have not yet been added to the database and were hand-summarized (these data will be added to and summarized by the database in the future).

Diet data for all species in all years were summarized using the AMNWR diet database (only ongoing diet datasets are presented here; additional diet datasets exist [Appendix I]). Diet is summarized for frequency of occurrence and percent composition for all species. For brevity, presentation of diet data highlights only prey items that make up more than 5% of diets. A more detailed summary of St. Paul diet data is presented in a consolidated refuge-wide diet report (Drummond 2016).

Data for all other parameters were summarized by hand.

The field crew also provided support to other researchers for various projects. In partnership with the National Institute of Standards and Technology, thick-billed murre eggs were collected for the Seabird Tissue Archival and Monitoring Project (STAMP), a long term program designed to track trends in

pollutants in northern marine environments using seabird eggs. The crew also assisted with COASST surveys for seabird carcasses coordinated by the St. Paul Ecosystem Conservation Office.

INTERESTING OBSERVATIONS

- Red-faced cormorants, a nearshore benthic feeder, had the highest productivity of all ledgenesting species monitored this season; 71% of nest starts fledged chicks with a fledgling rate of 1.65 chicks per nest start.
- Both black-legged kittiwakes and red-legged kittiwakes experienced complete reproductive failure, with a delayed and exceptionally low laying effort. All eggs were lost before hatching.
- Thick-billed murres had another low productivity year with just 7% of chicks fledging from total eggs laid. The majority of birds lost their eggs within 7 days of laying.
- Similar to last year, least auklets departed the island around July 18, approximately three weeks earlier than historically, presumably due to breeding failure. Parakeet auklets, the most abundant auklet on the island, departed prematurely as well.
- A total of 296 red-faced cormorant nests were observed during the period of 7 June to 3 July, with half of those located within a 600m stretch of coastline below the village water towers. Island-wide boat surveys were not conducted in 2017 and as a result only the west side of the island was searched for nests (Zolotoi Bay to Northwest Point). Despite the limited search area, this is the densest breeding concentration observed for the species in many years. During 2016 only 133 red-faced cormorant nests were observed during a boat-based circumnavigation survey of the entire island.
- In August a die off, primarily of dark morph northern fulmars as well as shearwaters, occurred with the birds mostly washing up on the north shore. More than 50 birds were encountered on island, with over 800 reported throughout the northern Bering Sea.
- A separate die-off occurred in mid-October 2016, and included mostly tufted puffins and crested auklets. Nearly 400 carcasses were recovered from this event.
- Several members of the community reported that sea ice reached St. Paul during the winter of 2016/2017.

ACKNOWLEDGMENTS

Brady Deal and Sarah Gilman worked tirelessly to collect much of the 2017 population and productivity data included in this report. Rolf Ream and Mike Williams (NOAA) gave helpful assistance and support at the NOAA Staff Quarters facilities on St. Paul. Pamela Lestenkof, Lauren Divine, and Veronica Padula with the St. Paul Ecosystem Conservation Office helped communicate seabird breeding conditions with the island community. Ann Harding, Tonia Kushin, Ram Papish (Alaska Seabird Youth Network), and Kendra Bush-St. Louis (USFWS) led another successful summer seabird camp; connecting the island youth with the breeding seabirds and marine environment. We thank the residents of St. Paul for their hospitality as well as Josh Cutler, Kristen Richardson and Shannon Moore with the fur seal resight crew for their camaraderie.

FIGURES AND TABLES

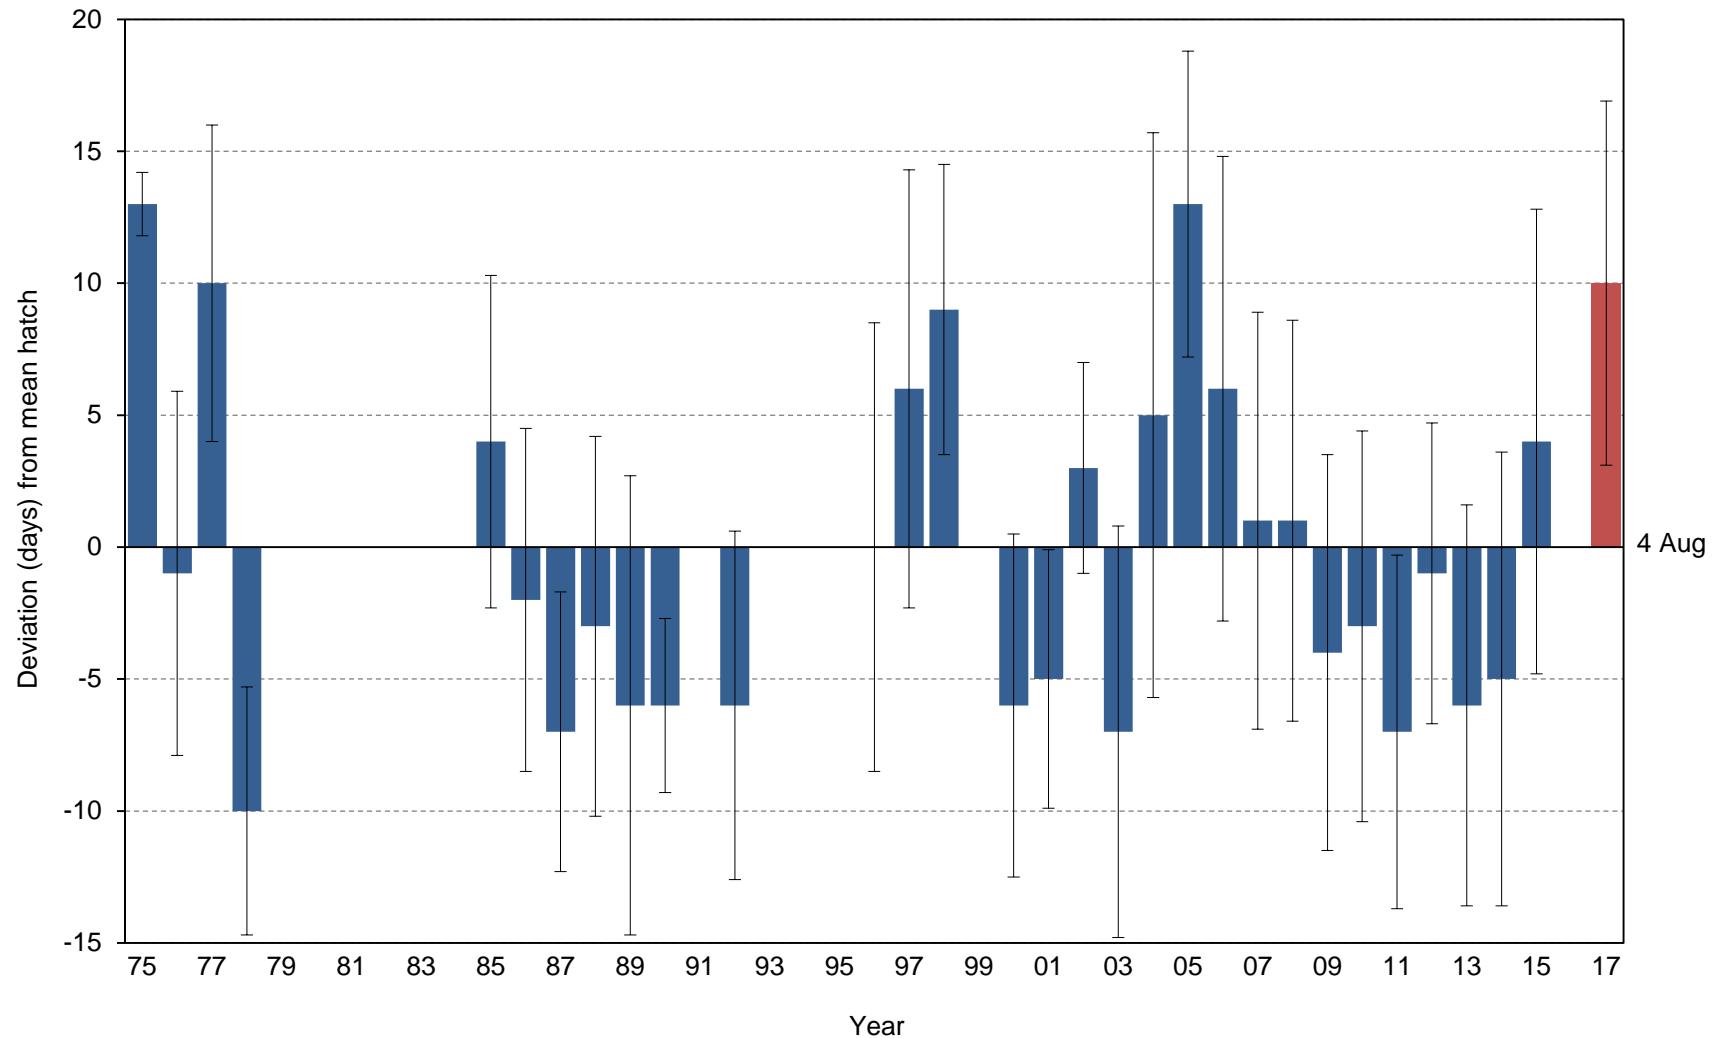

Figure 3. Yearly hatch date deviation (from the 1975-2016 mean of 4 August) for common murres at St. Paul Island, Alaska. Negative values indicate earlier than mean hatch date, positive values indicate later than mean hatch date. Error bars represent one standard deviation around each year's mean hatch date; red highlights the current year. No data were collected in 1979-1984, 1991, or 1993-1995 and no hatch dates were recorded with the appropriate egg-to-chick interval (≤ 7 days) in 1999; no eggs hatched in plots in 2016.

Table 1. Breeding chronology of common murres at St. Paul Island, Alaska. No data were collected in 1979-1984, 1991, or 1993-1995 and no hatch dates were recorded with the appropriate egg-to-chick interval (≤ 7 days) in 1999; no eggs hatched in plots in 2016.

^aSample sizes for mean hatch dates are a sub-sample of total nests for which egg-to-chick interval is ≤ 7 days.

^bIn years when no chicks fledged before the field crew left the island at the end of the season, date of first fledge is listed as > the date of last nest check.

^cxx indicates data potentially exist but have not yet been summarized.

Table 2. Frequency distribution of hatch dates for common murres at St. Paul Island, Alaska. Data include only nests in which observations of egg-to-chick ≤ 7 days. No data were collected in 1979-1984, 1991, or 1993-1995 and no hatch dates were recorded with the appropriate egg-to-chick interval in 1999; data for individual nests are not available before 1985 and no eggs hatched in plots in 2016.

Table 2 (continued). Frequency distribution of hatch dates for common murres at St. Paul Island, Alaska. Data include only nests in which observations of egg-to-chick \leq 7 days. No data were collected in 1979-1984, 1991, or 1993-1995 and no hatch dates were recorded with the appropriate egg-to-chick interval in 1999; data for individual nests are not available before 1985 and no eggs hatched in plots in 2016.

2017	48	5	1	0.10	0.20	0.02

^aFor single-egg species, nesting success (D/B) is the same as hatching success (E/C) because nest sites w/ eggs (B)=total eggs (C) and nest sites w/ chicks (D)=total chicks (E).

^bFor single-egg species, fledging success (F/B) is the same as chick success (G/E) because nest sites w/ chicks (D)=total chicks (E) and nest sites w/ chicks fledged (F)=total chicks fledged (G).

Table 4. Standard deviation in reproductive performance parameters of common murres at St. Paul Island, Alaska. Sampling for murres is clustered by plot except when sample sizes per plot are too small or plot data are not available. No data were collected in 1975, 1977, 1979-1984, 1991, or 1993-1995.

Year	No. plots ^a	Nest sites w/ eggs	Sampling design ^b	Nesting success	Fledging success	Reproductive success

2017	3	48	Cluster by plot	0.10	0.20	0.02

^aPlots that are combined for analysis are counted as a single "plot".

^bFor sampling clustered by plot, values are calculated based on plot as a sample unit; for simple random sampling, values are calculated using $\sqrt{\rho * (1 - \rho) / n}$, where ρ is the success rate and n is the sample size of individual nests.

^cxx indicates data potentially exist but have not yet been summarized.

Table 5. Reproductive performance of common murres at St. Paul Island, Alaska in 2017.

Parameter	Plots			Total	SD ^b
	104/48/81/84/116 ^a	114/90 ^a	64/66 ^a		
Nests w/ eggs (B)	15	17	16	48	-
Nests w/ chicks (D)	1	0	4	5	-
Nests w/ chicks fledged (F)	0	0	1	1	-
Nesting success (D/B) ^c	0.07	0.00	0.25	0.10	0.07
Fledging success (F/D) ^d	0.00	0.00	0.25	0.20	0.07
Reproductive success (F/B)	0.00	0.00	0.06	0.02	0.02

^aPlots were combined for statistical purposes.

^bStandard deviations are calculated based on plot as a sample unit.

^cFor single-egg species, nesting success (D/B) is the same as hatching success (E/C) because nest sites w/ eggs (B)=total eggs (C) and nest sites w/ chicks (D)=total chicks (E).

^dFor single-egg species, fledging success (F/B) is the same as chick success (G/E) because nest sites w/ chicks (D)=total chicks (E) and nest sites w/ chicks fledged (F)=total chicks fledged (G).

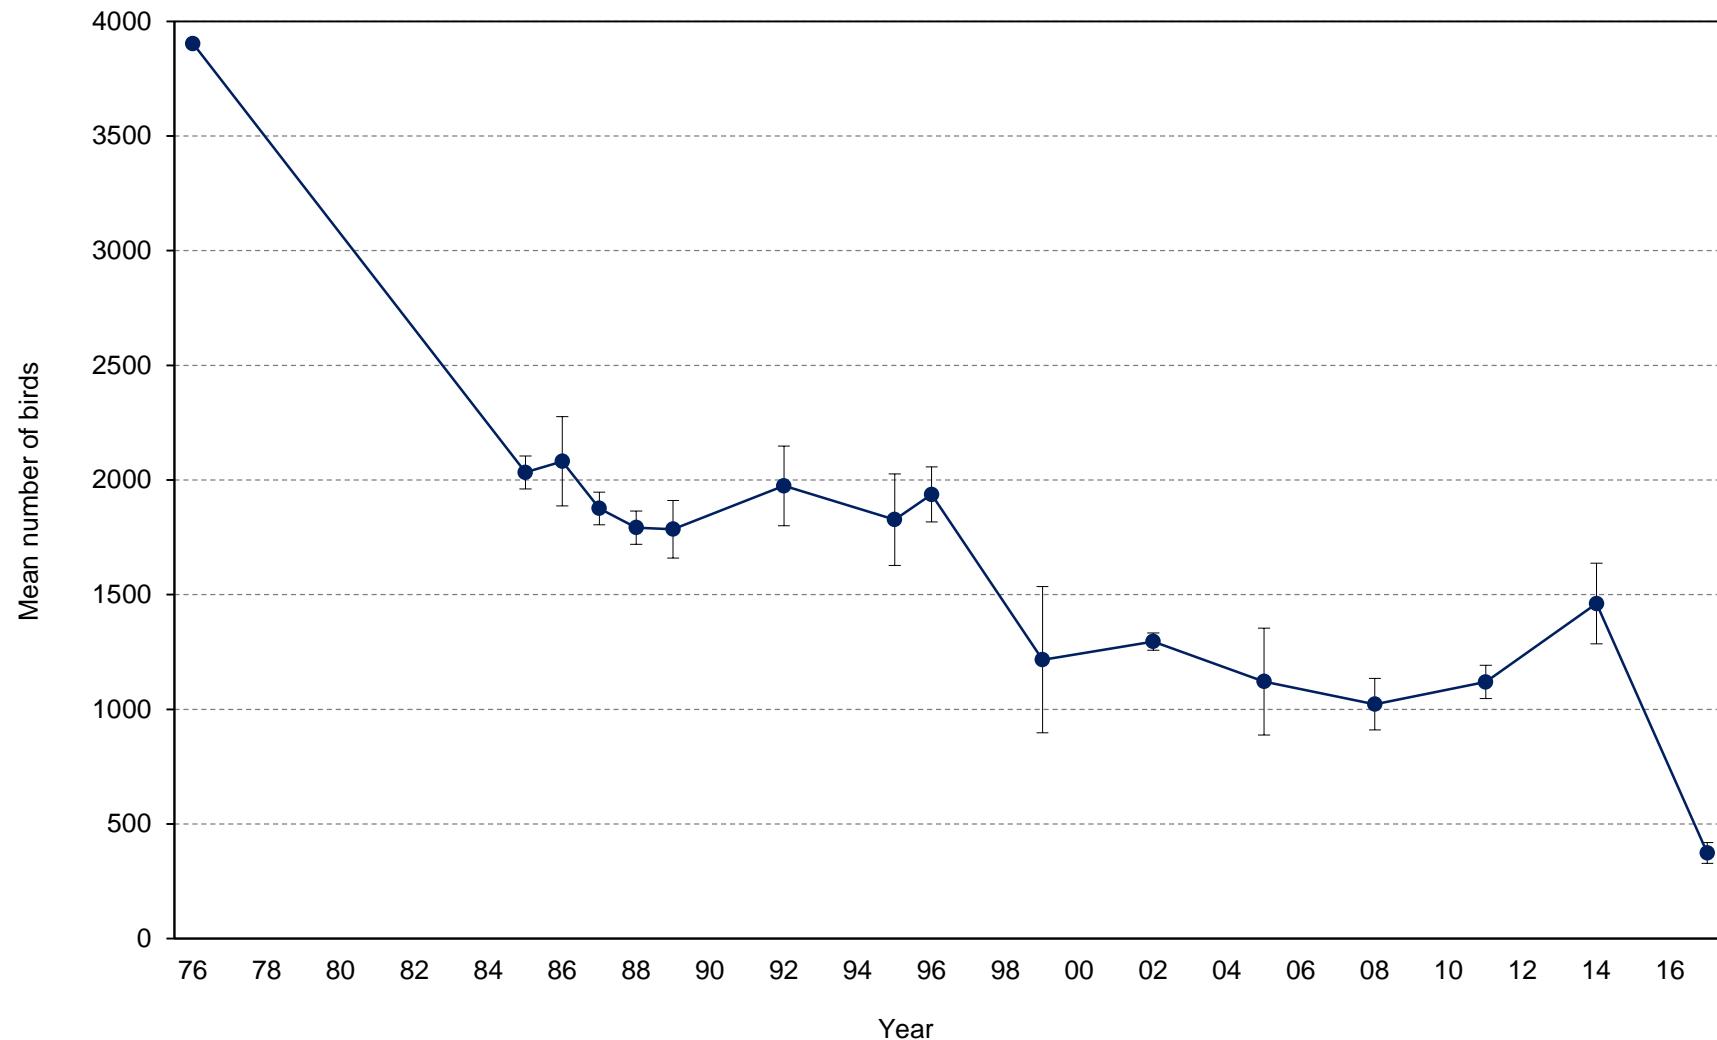

Figure 5. Mean numbers of common murres counted on index plots at St. Paul Island, Alaska. Totals include all plots except 2ne, 6, 9, 16, 17, 19btm, 20btm, 21, 29, 29new, and 30. Error bars represent standard deviation. No counts were conducted in years not shown except 1982 and 1984 when data are excluded because not all plots were counted.

Table 6. Numbers of common murres counted on index plots at St. Paul Island, Alaska. Totals include all plots except 2ne, 6, 9, 16, 17, 19btm, 20btm, 21, 29, 29new, and 30. No counts were conducted in years not listed except 1982 and 1984 when data are excluded because not all plots were counted.

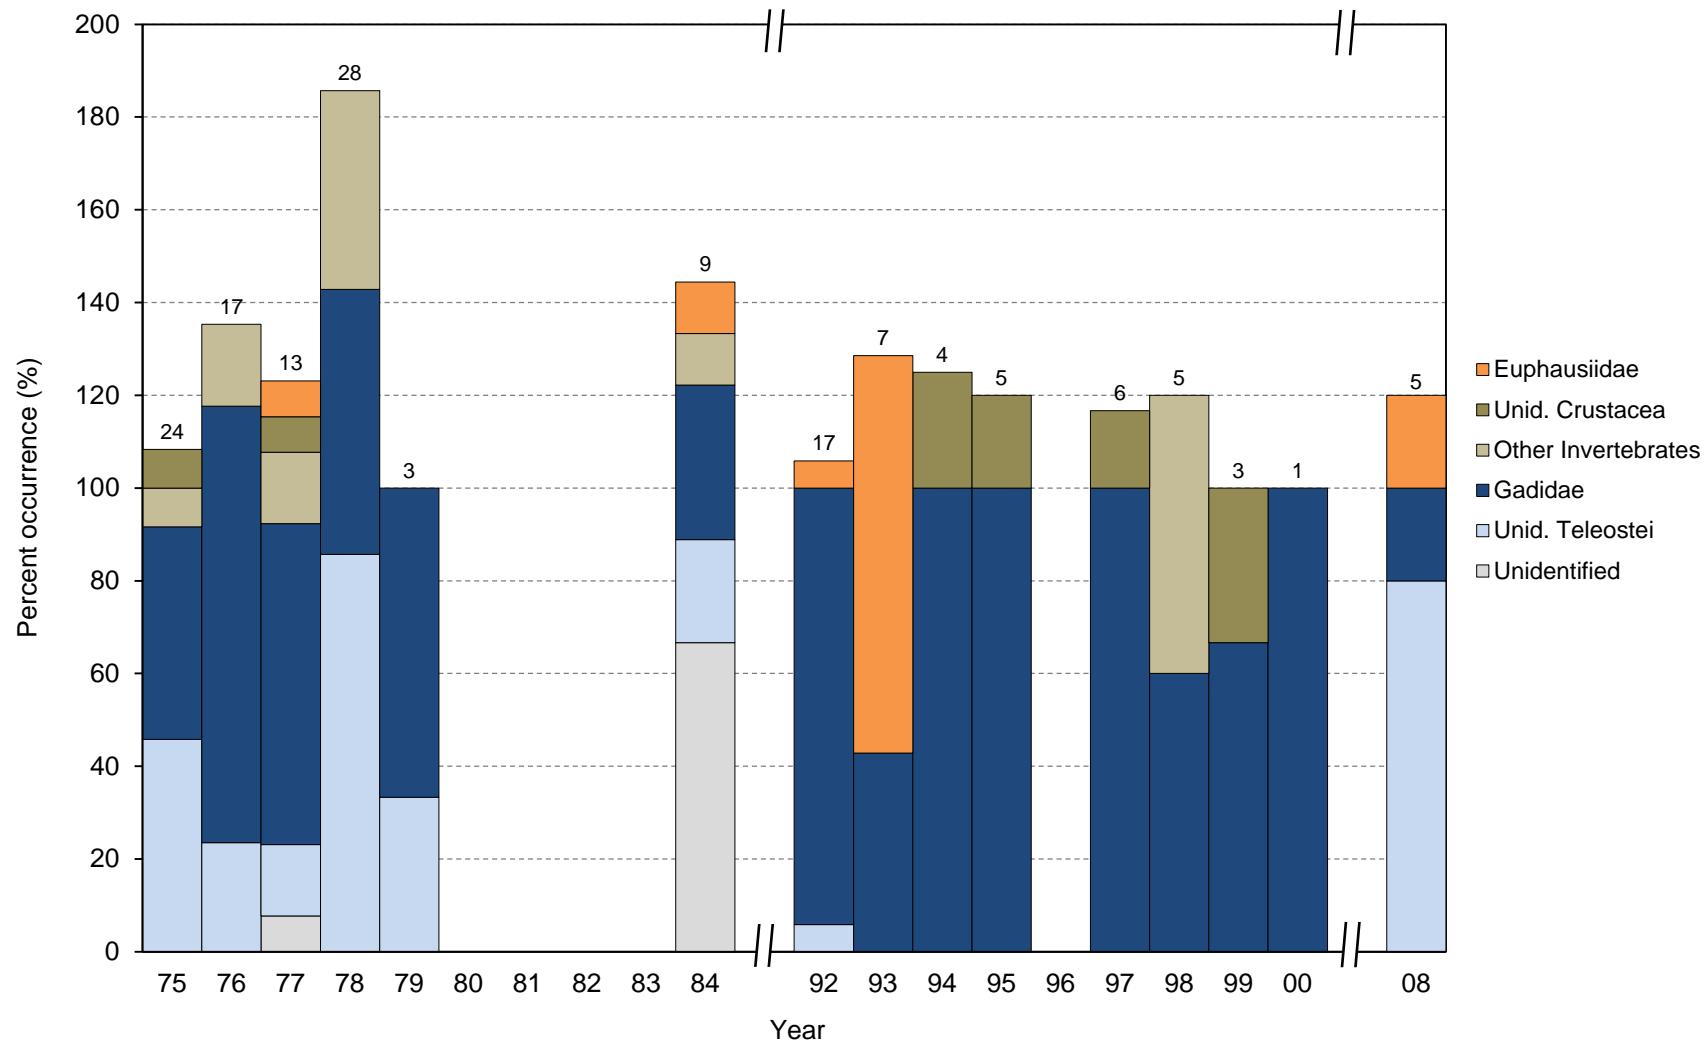

Figure 6. Frequency of occurrence of major prey items in diets of common murre adults at St. Paul Island, Alaska. Frequency is expressed as the percentage of food samples in which each prey item was present. Prey is grouped to family level or higher; only taxa with an among-year average occurrence of at least 5% are shown. Samples consist of stomach contents collected from adults near or at the colony. Numbers above columns indicate sample sizes. No diet samples were collected in 1980-1983, 1985-1991, 1996, 2001-2007, or after 2008.

Table 8. Frequency of occurrence of major prey items in diets of common murre adults at St. Paul Island, Alaska. Frequency is expressed as the percentage of food samples in which each prey item was present. Prey was identified and measured in the laboratory to lowest taxon possible (some prey items were identified to species while others were only identified to genus, family, order, etc.). Any prey with an among-year average occurrence of at least 5% are shown to the lowest taxonomic level; others are lumped together as “others” in their respective taxonomic group with values in bold showing totals for those taxa. Samples consist of stomach contents collected from adults near or at the colony. No diet samples were collected in 1980-1983, 1985-1991, 1996, 2001-2007, or after 2008. More detailed diet data and prey identifications are available, contact refuge biologists for details.

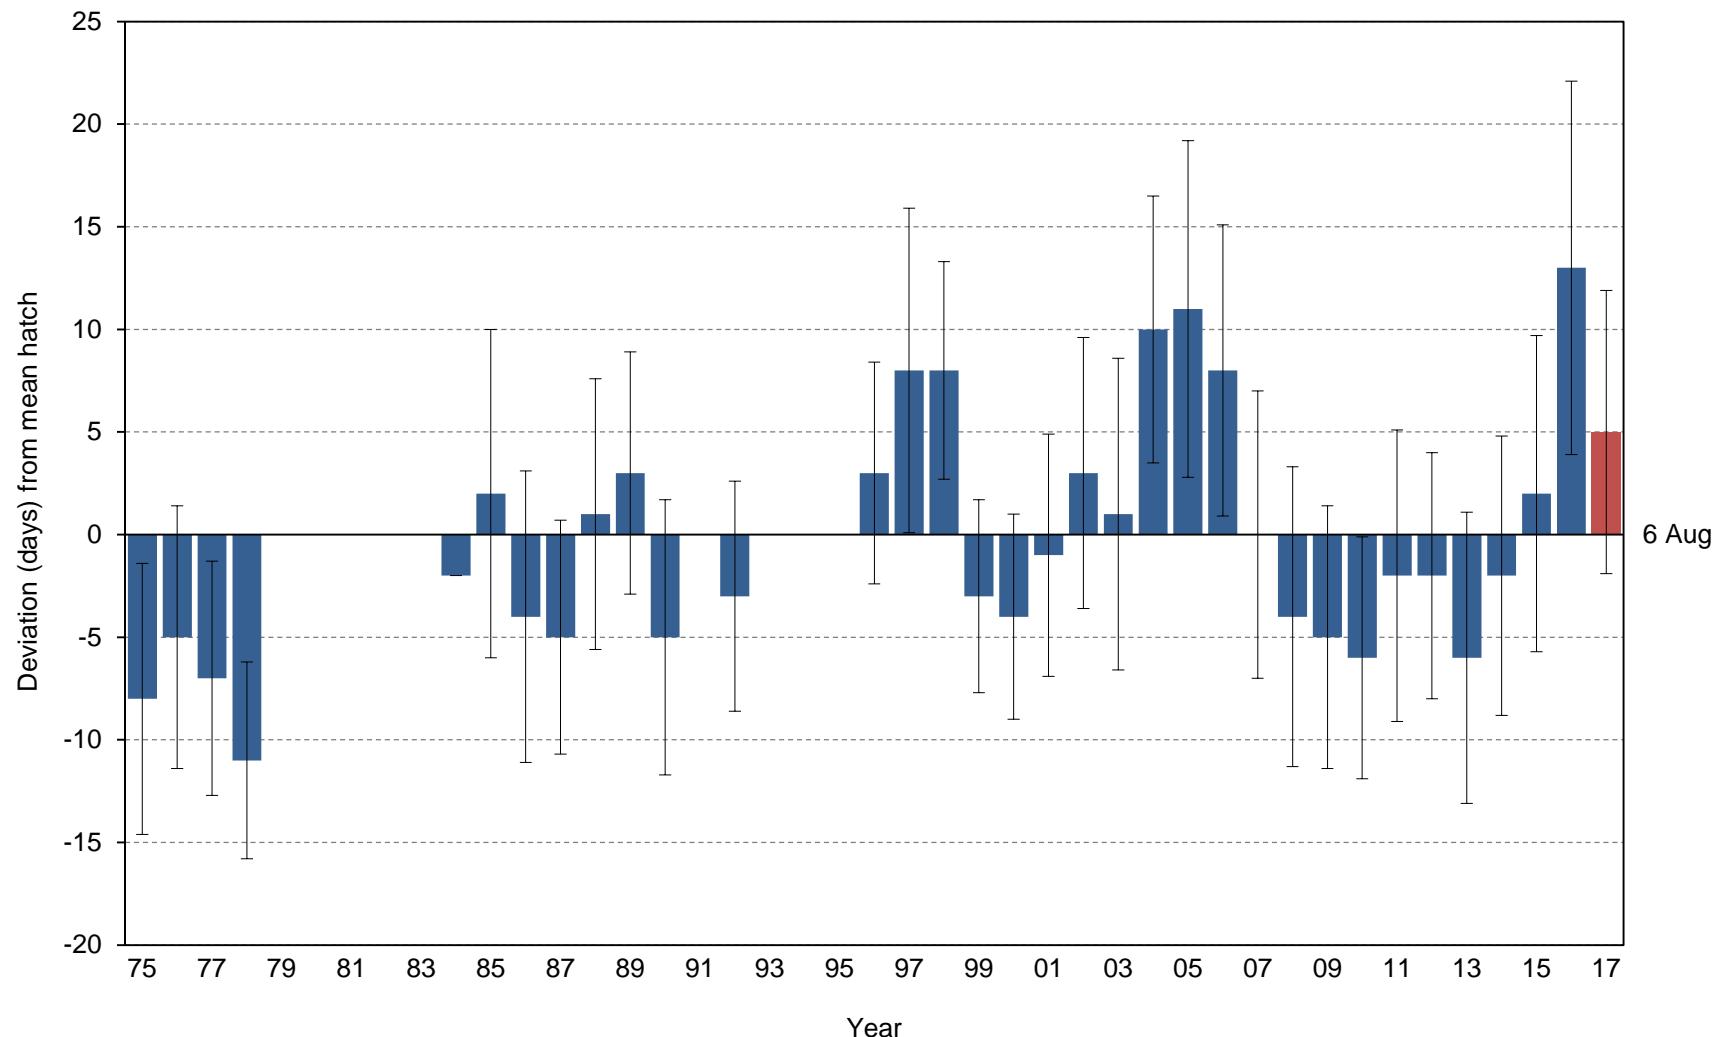

Figure 10. Yearly hatch date deviation (from the 1975-2016 mean of 6 August) for thick-billed murres at St. Paul Island, Alaska. Negative values indicate earlier than mean hatch date, positive values indicate later than mean hatch date. Error bars represent one standard deviation around each year's mean hatch date; red highlights the current year. No data were collected in 1979-1983, 1991, or 1993-1995.

Table 12. Breeding chronology of thick-billed murres at St. Paul Island, Alaska. No data were collected in 1979-1983, 1991, or 1993-1995.

^aSample sizes for mean hatch dates are a sub-sample of total nests for which egg-to-chick interval is ≤ 7 days.

^bIn years when no chicks fledged before the field crew left the island at the end of the season, date of first fledge is listed as > the date of last nest check.

^cxx indicates data potentially exist but have not yet been summarized.

Table 13. Frequency distribution of hatch dates for thick-billed murres at St. Paul Island, Alaska. Data include only nests in which observations of egg-to-chick ≤ 7 days. No data were collected in 1979-1983, 1991, or 1993-1995; data from individual nests are not available before 1984.

Table 13 (continued). Frequency distribution of hatch dates for thick-billed murres at St. Paul Island, Alaska. Data include only nests in which observations of egg-to-chick \leq 7 days. No data were collected in 1979-1983, 1991, or 1993-1995; data from individual nests are not available before 1984.

2017	243	29	18	0.12	0.62	0.07

^aFor single-egg species, nesting success (D/B) is the same as hatching success (E/C) because nest sites w/ eggs (B)=total eggs (C) and nest sites w/ chicks (D)=total chicks (E).

^bFor single-egg species, fledging success (F/B) is the same as chick success (G/E) because nest sites w/ chicks (D)=total chicks (E) and nest sites w/ chicks fledged (F)=total chicks fledged (G).

^cValues in parentheses were not reported by original investigators and are estimated from other known parameters.

^dReported values are the midpoint of a range (see Appendix E).

Table 15. Standard deviation in reproductive performance parameters of thick-billed murres at St. Paul Island, Alaska. Sampling for murres is clustered by plot except when sample sizes per plot are too small or plot data are not available. No data were collected in 1979-1983, 1991, or 1993-1995.

^aPlots that are combined for analysis are counted as a single "plot".

^bFor sampling clustered by plot, values are calculated based on plot as a sample unit; for simple random sampling, values are calculated using $\sqrt{\rho * (1 - \rho) / n}$, where ρ is the success rate and n is the sample size of individual nests.

^cStandard deviations are not calculated for success values that are midpoint estimates.

^dxx indicates data potentially exist but have not yet been summarized.

Table 16. Reproductive performance of thick-billed murres at St. Paul Island, Alaska in 2017.

^aPlots were combined for statistical purposes.

^bStandard deviations are calculated based on plot as a sample unit.

^cFor single-egg species, nesting success (D/B) is the same as hatching success (E/C) because nest sites w/ eggs (B)=total eggs (C) and nest sites w/ chicks (D)=total chicks (E).

^dFor single-egg species, fledging success (F/B) is the same as chick success (G/E) because nest sites w/ chicks (D)=total chicks (E) and nest sites w/ chicks fledged (F)=total chicks fledged (G).

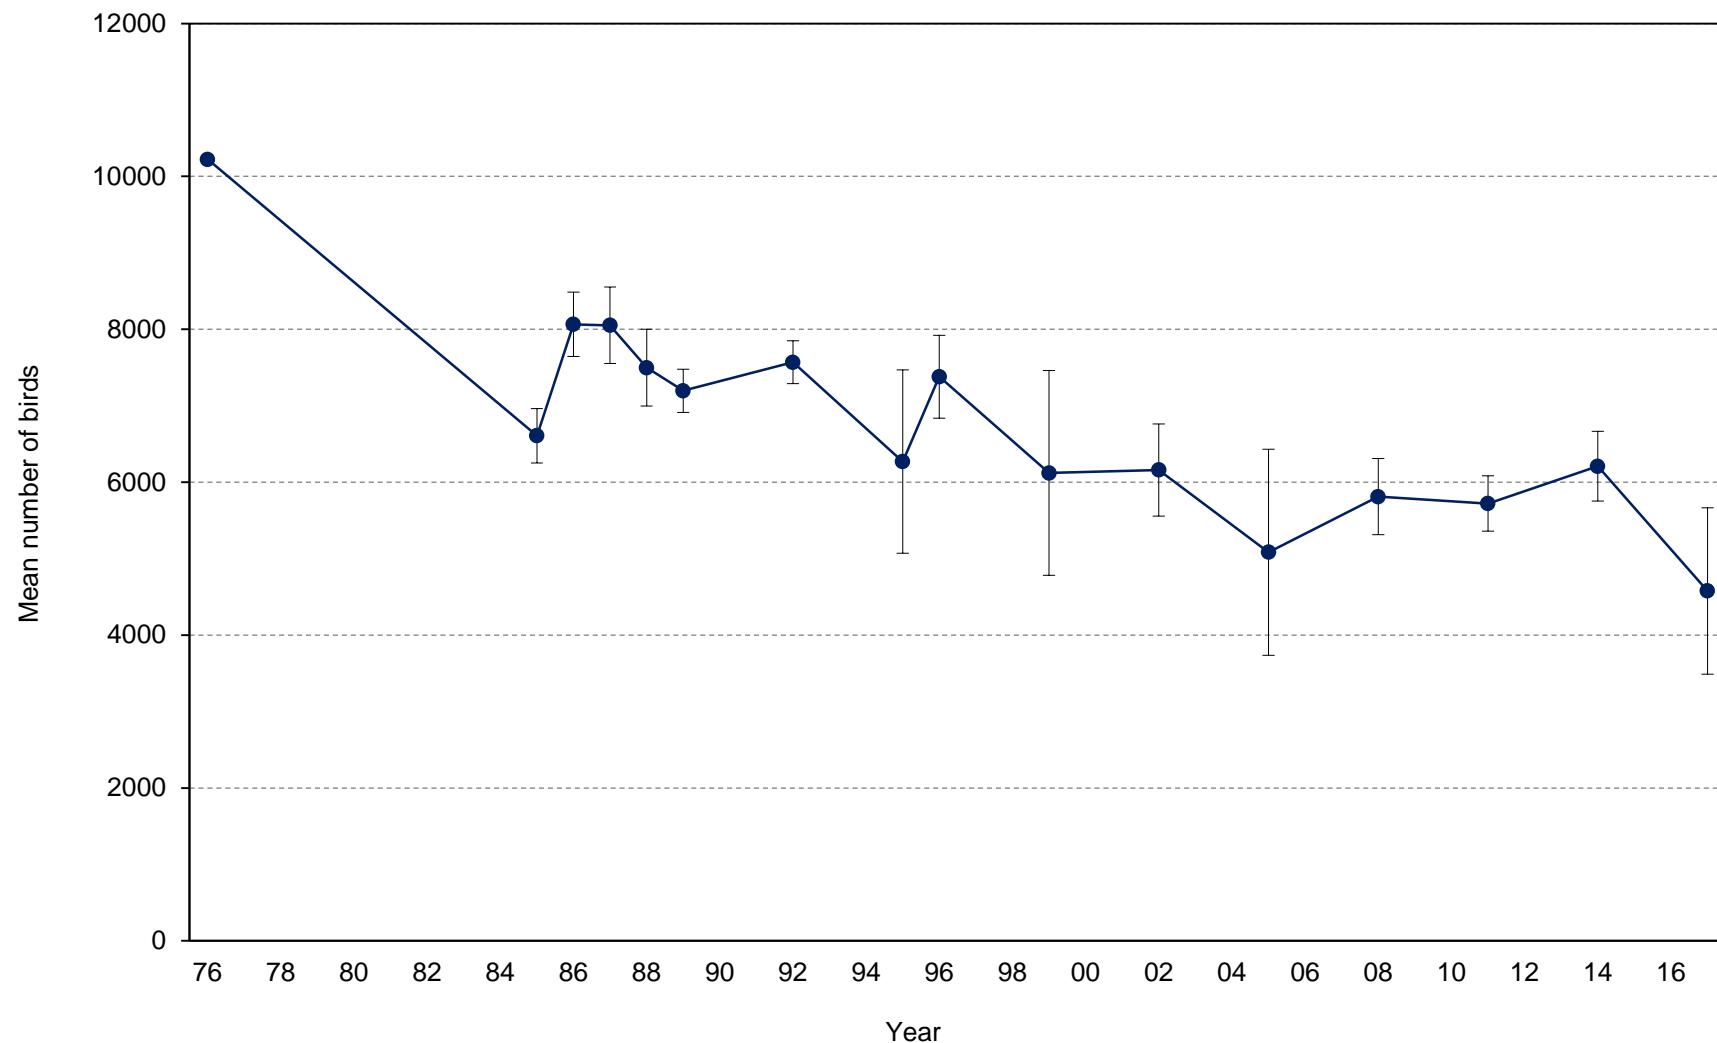

Figure 12. Mean numbers of thick-billed murres counted on index at St. Paul Island, Alaska. Totals include all plots except 2ne, 6, 9, 16, 17, 19btm, 20btm, 21, 29, 29new, and 30. Error bars represent standard deviation. No counts were conducted in years not shown except 1982 and 1984 when data are excluded because not all plots were counted.

Table 17. Numbers of thick-billed murres counted on index plots at St. Paul Island, Alaska. Totals include all plots except 2ne, 6, 9, 16, 17, 19btm, 20btm, 21, 29, 29new, and 30. No counts were conducted in years not listed except 1982 and 1984 when data are excluded because not all plots were counted.

<hr/>											
Resighting effort ^d											
Total no. resight days		4	11	22	29	13	26	23	23	23	-
Total no. resight hours		N/A ^e	18.9	11.3	16.9	4.5	N/A	6.5	9	14.8	-

^aBirds banded in current year are not resighted until following year and not included in current year totals.

^bValue equals the sum of birds resighted in prior year + birds not resighted in prior year but resighted in future years and thus known to have been alive in prior year + new birds banded in prior year.

^cSurvival should be considered a minimum estimate because it is likely not all birds present were observed each year.

^dResighting effort represents sum of time spent at survival plots and includes only dedicated resighting time, not incidental observations made during other work. Hours are calculated by people-hours: 2 people resighting for 1 hour each = 2 resight hours.

^eN/A indicates total resight hours not recorded.

Table 21. Resight history of adult thick-billed murres banded on survival plots at St. Paul Island, Alaska. Values represent number of times birds were resighted each year. Color codes are recorded as color and # of band for birds banded with alphanumeric color bands, and as colors (in code) of bands on left (L) and right (R) legs for birds banded with three band combinations.

Codes: Color combos DB = dark blue R = red DG = dark green W = white O = orange Y = yellow				Location ZD = Zapadni Dip PZD = Past Zapadni Dip Z84 = Zapadni Plot 84 TO = Tolstoi				Resight history 0 = not resighted x = band no longer resightable (dead, removed, etc.)

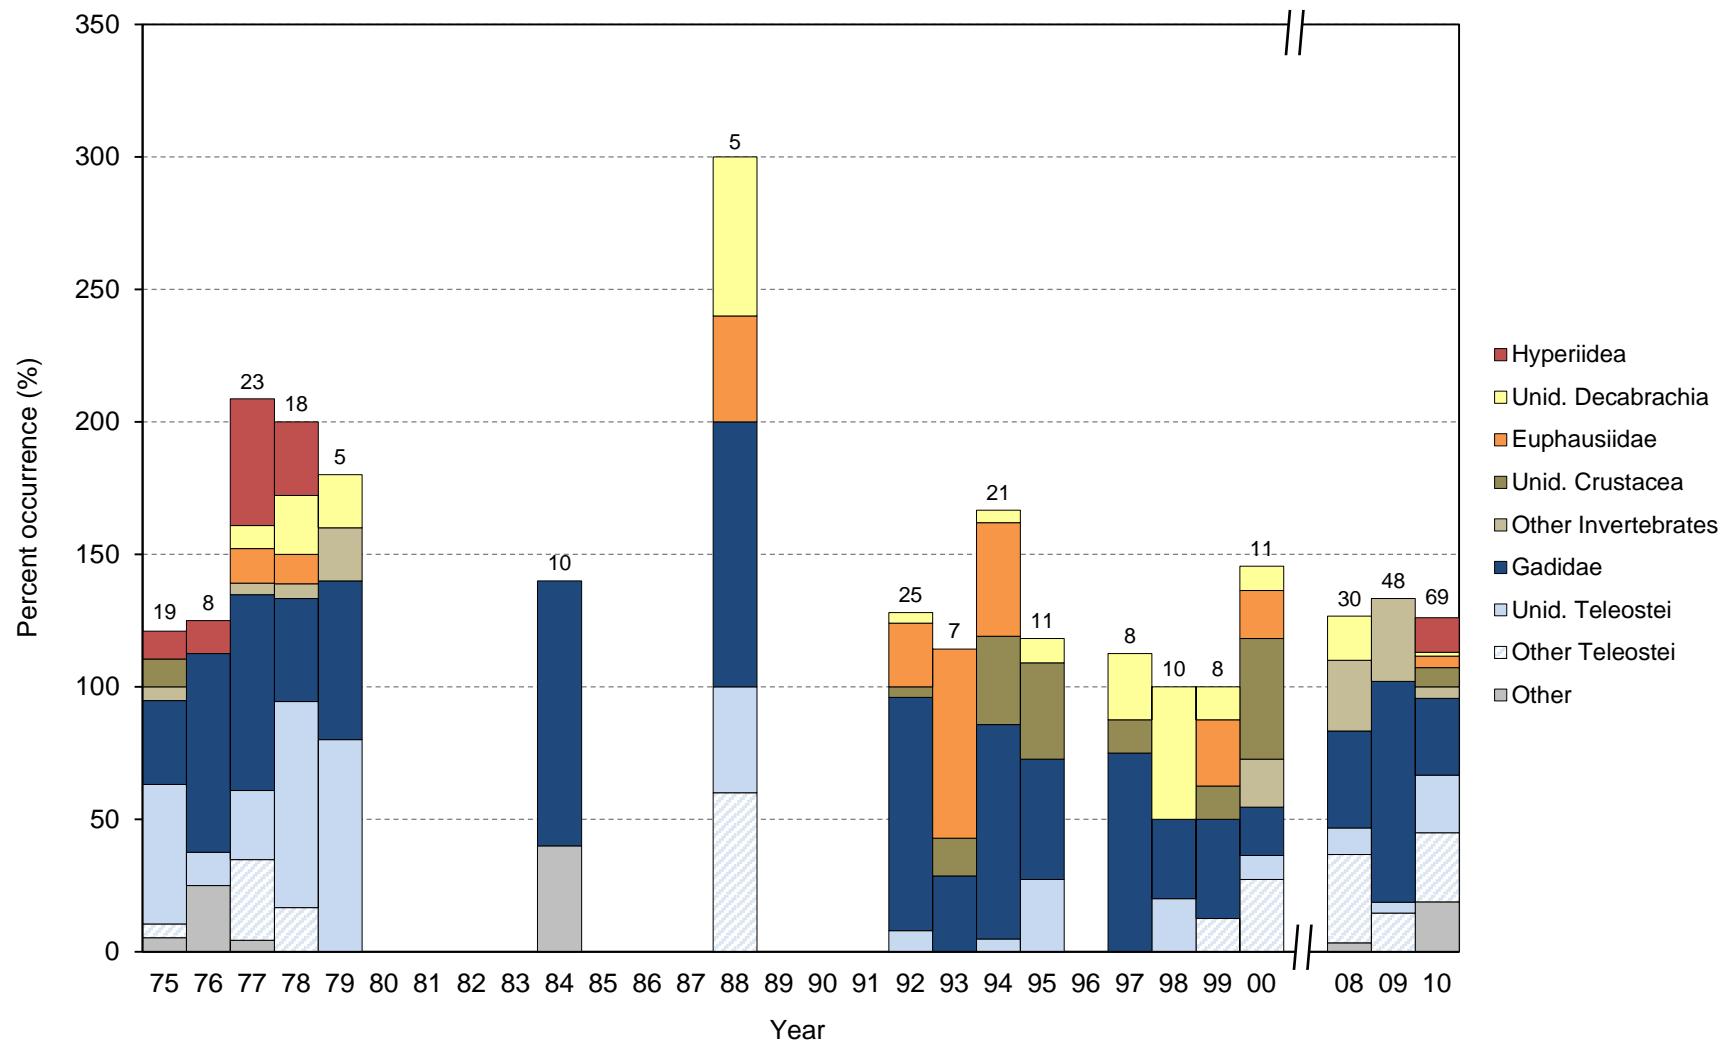

Figure 13. Frequency of occurrence of major prey items in diets of thick-billed murre adults at St. Paul Island, Alaska. Frequency is expressed as the percentage of food samples in which each prey item was present. Prey is grouped to family level or higher; only taxa with an among-year average occurrence of at least 5% are shown. Samples consist of stomach contents collected from adults near or at the colony. Numbers above columns indicate sample sizes. No diet samples were collected in 1980-1983, 1985-1987, 1989-1991, 1996, 2001-2007, or after 2010.

Table 22. Frequency of occurrence of major prey items in diets of thick-billed murre adults at St. Paul Island, Alaska. Frequency is expressed as the percentage of food samples in which each prey item was present. Prey was identified and measured in the laboratory to lowest taxon possible (some prey items were identified to species while others were only identified to genus, family, order, etc.). Any prey with an among-year average occurrence of at least 5% are shown to the lowest taxonomic level; others are lumped together as "others" in their respective taxonomic group with values in bold showing totals for those taxa. Samples consist of stomach contents collected from adults near or at the colony. No diet samples were collected in 1980-1983, 1985-1987, 1989-1991, 1996, 2001-2007, or after 2010. More detailed diet data and prey identifications are available, contact refuge biologists for details.

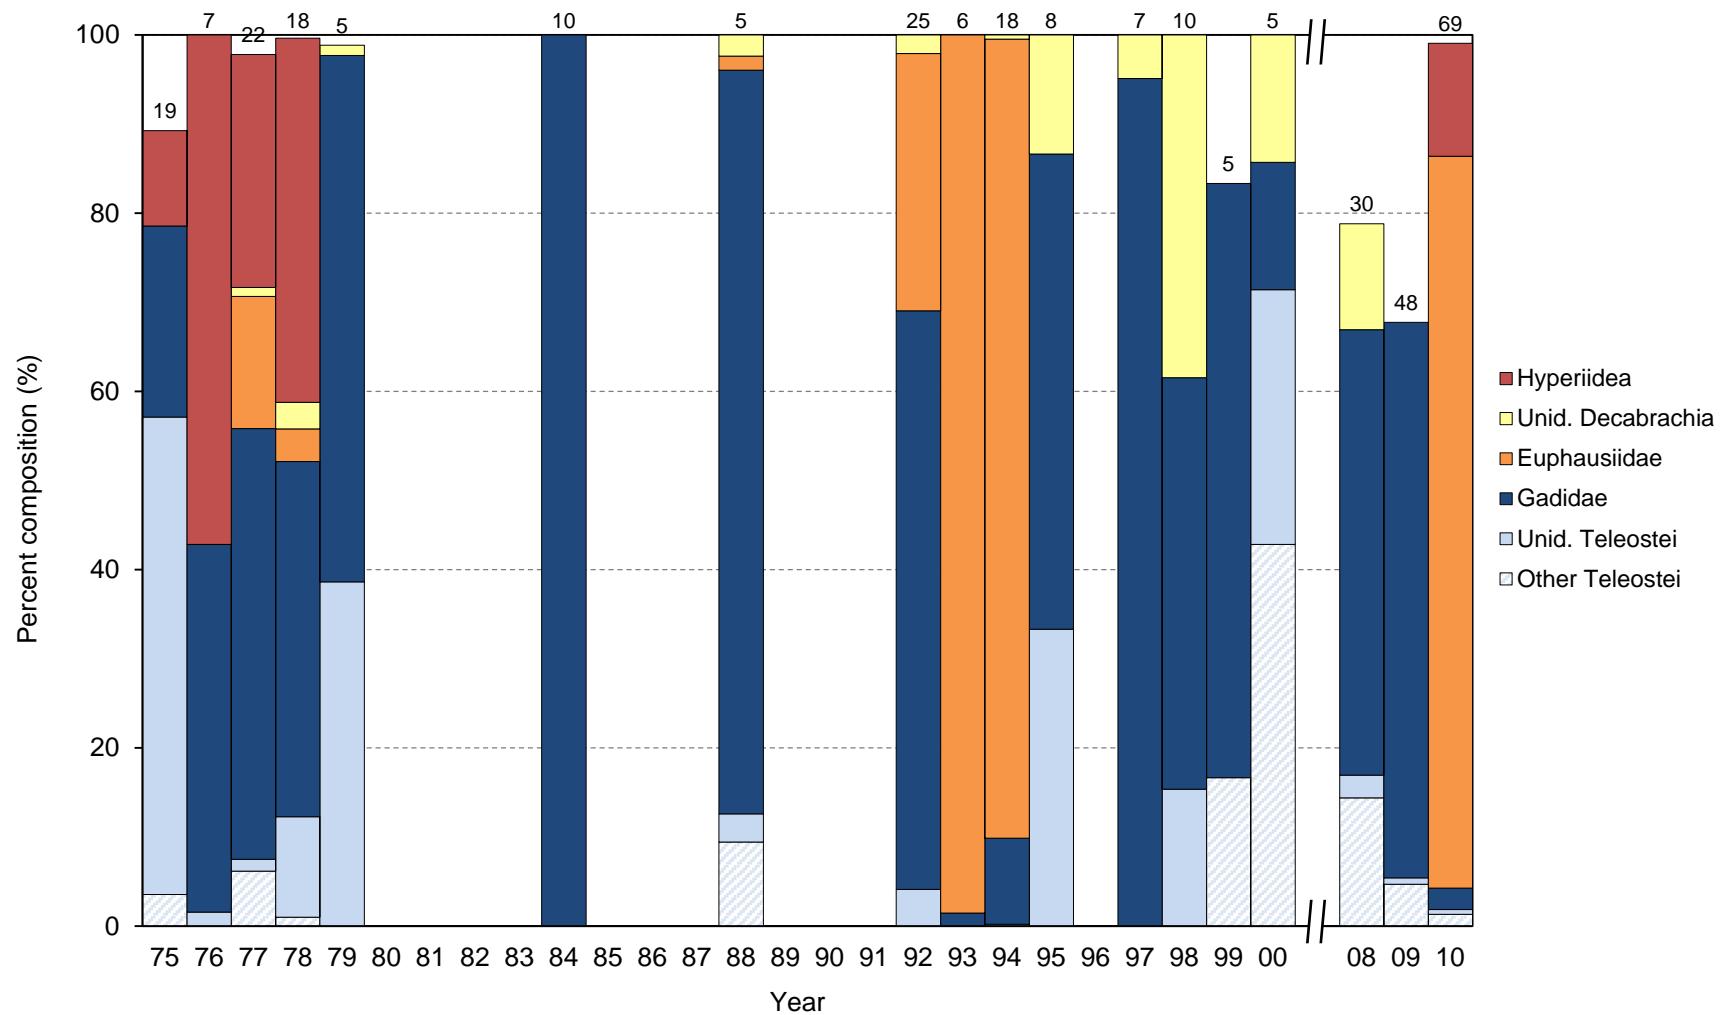

Figure 14. Percent composition of major prey items in diets of thick-billed murre adults at St. Paul Island, Alaska. Values are expressed as the percentage of total individual prey items comprised by each prey item. Prey is grouped to family level or higher; only taxa with an among-year average composition of at least 5% are shown. Samples consist of stomach contents collected from adults near or at the colony. Numbers above columns indicate sample sizes. No diet samples were collected in 1980-1983, 1985-1987, 1989-1991, 1996, 2001-2007, or after 2010.

Table 23. Percent composition of major prey items in diets of thick-billed murre adults at St. Paul Island, Alaska. Values are expressed as the percentage of total individual prey items comprised by each prey item (sums to 100% each year). Prey was identified and measured in the laboratory to lowest taxon possible (some prey items were identified to species while others were only identified to genus, family, order, etc.). Any prey with an among-year average composition of at least 5% are shown to the lowest taxonomic level; others are lumped together as "others" in their respective taxonomic group with values in bold showing totals for those taxa. Samples consist of stomach contents collected from adults near or at the colony. No diet samples were collected in 1980-1983, 1985-1987, 1989-1991, 1996, 2001-2007, or after 2010. More detailed diet data and prey identifications are available, contact refuge biologists for details.

^aTwo additional samples are still pending analysis.

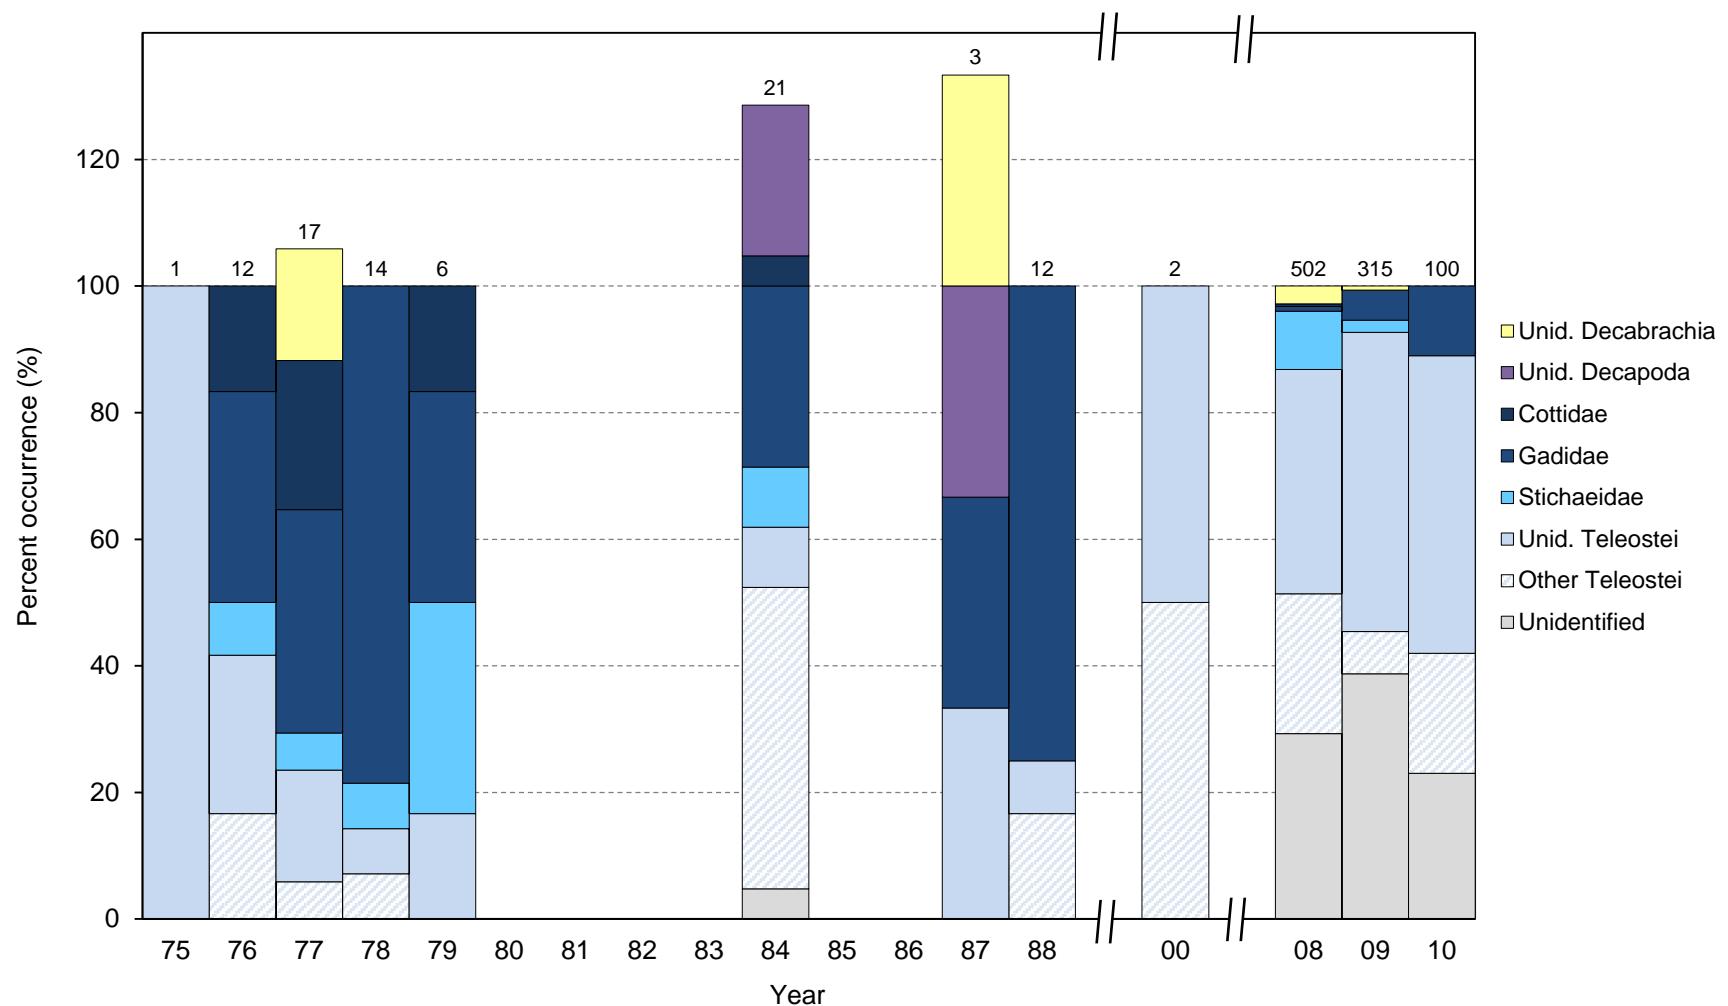

Figure 15. Frequency of occurrence of major prey items in diets of thick-billed murre chicks at St. Paul Island, Alaska. Frequency is expressed as the percentage of food samples in which each prey item was present. Prey is grouped to family level or higher; only taxa with an among-year average occurrence of at least 5% are shown. Samples consist of bill loads collected (1975-1988) and observed (2000- 2010) from adults returning to the colony to feed chicks, as well as regurgitations collected from chicks (1976, 1979-1988). Numbers above columns indicate sample sizes. No diet samples were collected in 1980-1983, 1985-1986, 1989-1999, or after 2010.

Table 24. Frequency of occurrence of major prey items in diets of thick-billed murre chicks at St. Paul Island, Alaska. Frequency is expressed as the percentage of food samples in which each prey item was present. Prey was identified and measured in the laboratory to lowest taxon possible (some prey items were identified to species while others were only identified to genus, family, order, etc.). Any prey with an among-year average occurrence of at least 5% are shown to the lowest taxonomic level; others are lumped together as “others” in their respective taxonomic group with values in bold showing totals for those taxa. Samples consist of bill loads collected (1975-1988) and observed (2000- 2010) from adults returning to the colony to feed chicks, as well as regurgitations collected from chicks (1976, 1979-1988). No diet samples were collected in 1980-1983, 1985-1986, 1989-1999, or after 2010. More detailed diet data and prey identifications are available, contact refuge biologists for details.

Cum. total birds banded (adults and subadults)	89	163	167	167	167	168	174	174	174	175	259	262	344	371	381	382	426	431	431	

Table 27. Fates of cohorts of least auklets banded on survival plot at St. Paul Island, Alaska. Data do not include birds banded as subadults ($n=19$). Banding dates were not recorded for some birds so these data are presented as a range of potential banding dates (e.g., ≤ 1988). Annual resight effort data are unknown. Monitoring of auklet survival ended at St. Paul after 2002 and moved to neighboring St. George Island in 2003.

Year	No. birds banded in year ^a	No. birds resighted in:														Proportion banded birds alive in 2002

2000	44										(44)	31	23				0.52	
2001	5											(5)	4				0.80	
No. birds seen in current year (A)	-	67	92	-	-	90	38	0	28	22	87	103	103	81	105	59	-	
Birds potentially alive from prior year (B) ^c	-	85	144	-	-	148	155	117	94	94	164	223	191	162	165	123	-	
Apparent annual survival (A/B) ^d	-	0.79	0.64	-	-	0.61	0.25	0.00	0.30	0.23	0.53	0.46	0.54	0.50	0.64	0.48	-	

^aData include only those birds resighted at least once after banding (either in the year of banding or in future years); birds banded but never again seen on the plot are excluded from the survival dataset. Therefore, these values may be less than the total number of birds banded reported in Table 28.

^bNot all birds banded in the current year had the opportunity to be resighted that year because banding often occurred towards the end of the resighting season. Therefore, the number of birds resighted the year they were banded should not be considered an accurate estimate of survival.

^cValue equals the sum of birds resighted in prior year + birds not resighted in prior year but resighted in future years and thus known to have been alive in prior year + new birds banded in prior year. For these purposes, birds banded in ≤ 1996 and 1996 are lumped as birds banded the year prior to 1997; birds banded in ≤ 1997 and 1997 are lumped as birds banded in the year prior to 1998, birds banded in ≤ 2000 and 2000 are lumped as birds banded the year prior to 2001.

^dSurvival should be considered a minimum estimate because it is likely not all birds present were observed each year and, in some years, small numbers of birds with missing bands were observed and could not be individually identified.

Table 28. Resight history of least auklets banded on survival plot at St. Paul Island, Alaska. All birds were banded as adults unless otherwise noted. Data do not include six color-combinations used on duplicate birds, making individual resight history impossible to determine. Monitoring of auklet survival ended at St. Paul after 2002 and moved to neighboring St. George Island in 2003.

Table 28 (continued). Resight history of least auklets banded on survival plot at St. Paul Island, Alaska. All birds were banded as adults unless otherwise noted. Data do not include six color-combinations used on duplicate birds, making individual resight history impossible to determine. Monitoring of auklet survival ended at St. Paul after 2002 and moved to neighboring St. George Island in 2003.

Table 28 (continued). Resight history of least auklets banded on survival plot at St. Paul Island, Alaska. All birds were banded as adults unless otherwise noted. Data do not include six color-combinations used on duplicate birds, making individual resight history impossible to determine. Monitoring of auklet survival ended at St. Paul after 2002 and moved to neighboring St. George Island in 2003.

Table 28 (continued). Resight history of least auklets banded on survival plot at St. Paul Island, Alaska. All birds were banded as adults unless otherwise noted. Data do not include six color-combinations used on duplicate birds, making individual resight history impossible to determine. Monitoring of auklet survival ended at St. Paul after 2002 and moved to neighboring St. George Island in 2003.

Table 28 (continued). Resight history of least auklets banded on survival plot at St. Paul Island, Alaska. All birds were banded as adults unless otherwise noted. Data do not include six color-combinations used on duplicate birds, making individual resight history impossible to determine. Monitoring of auklet survival ended at St. Paul after 2002 and moved to neighboring St. George Island in 2003.

Codes:		BK = black	DG = dark green	O = orange	W = white	2+ = resighted at least twice												y = resighted (# times unknown)				
		GY = gray	LB = light blue	R = red	Y = yellow	1 = resighted once only												0 = not resighted				
		DB = dark blue	LG = light green

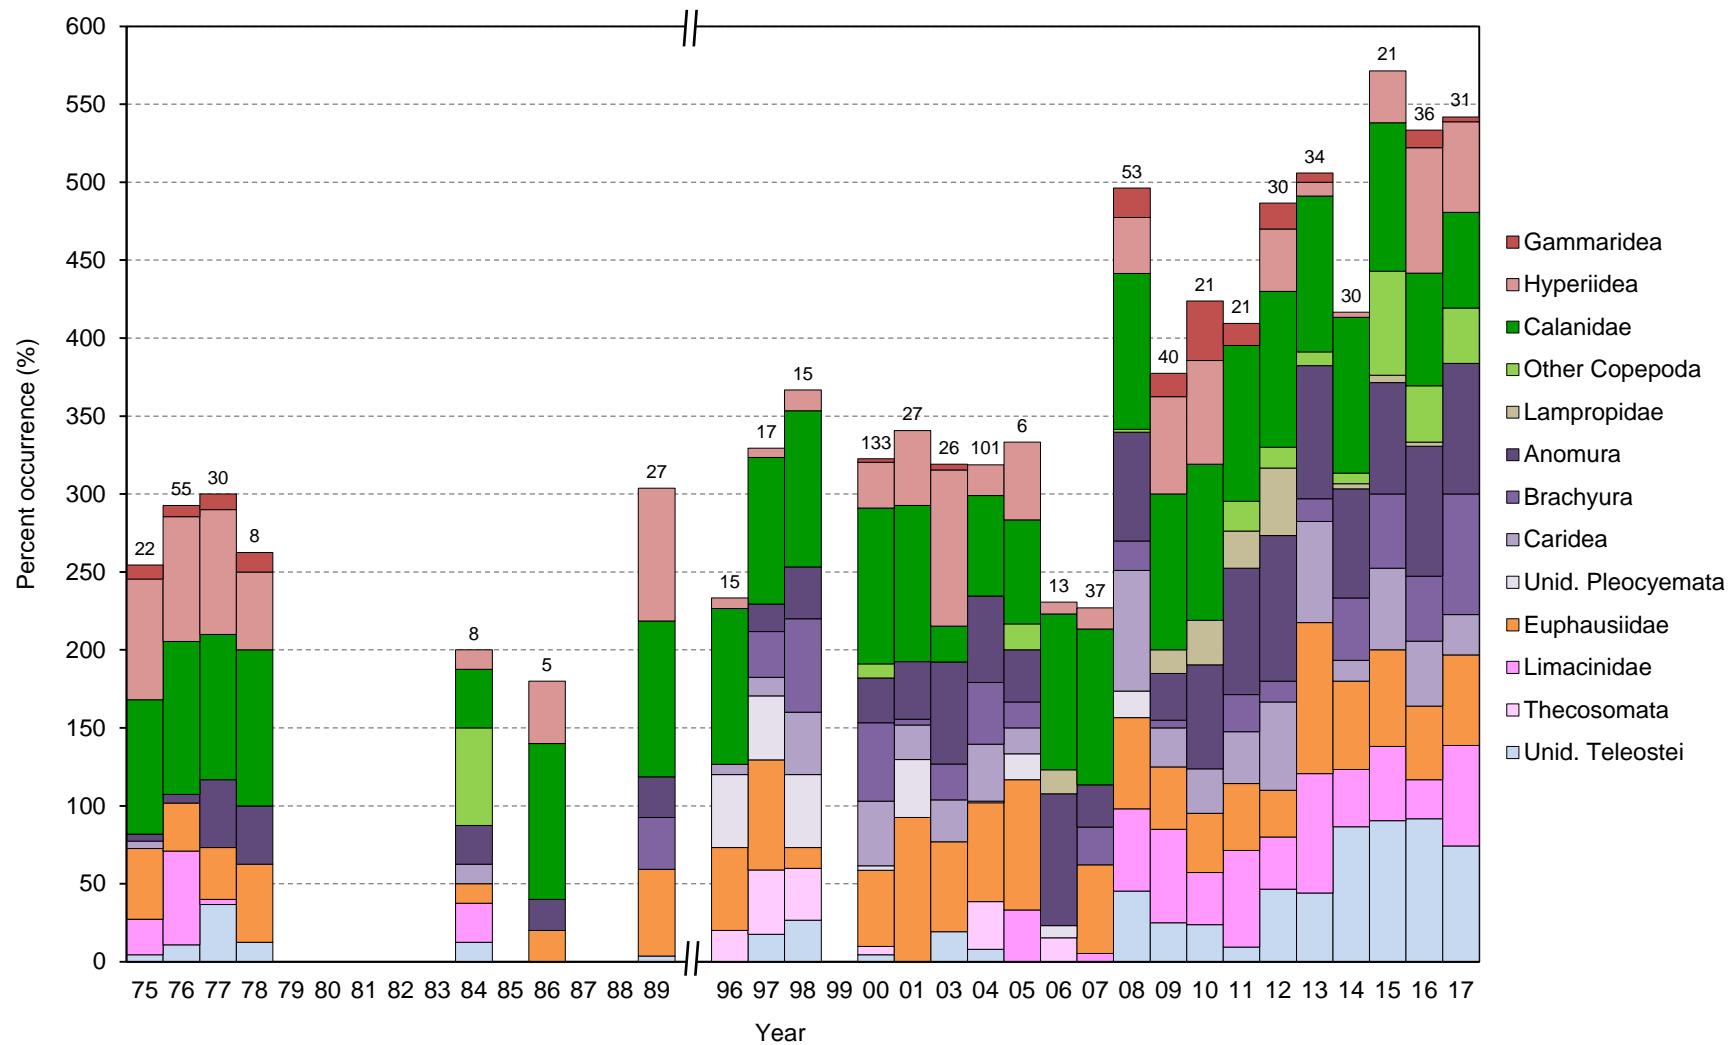

Figure 17. Frequency of occurrence of major prey items in diets of least auklet chicks at St. Paul Island, Alaska. Frequency is expressed as the percentage of food samples in which each prey item was present. Prey is grouped to family level or higher; only taxa with an among-year average occurrence of at least 5% are shown. Samples consist of regurgitations from adults returning to the colony to feed chicks (1975-1978, 1986-2017) and gular pouch contents from adults collected at or near the colony (1984). Numbers above columns indicate sample sizes. No diet samples were collected in 1979-1983, 1985, 1987-1988, 1990-1995, 1999, or 2002.

Table 29. Frequency of occurrence of major prey items in diets of least auklet chicks at St. Paul Island, Alaska. Frequency is expressed as the percentage of food samples in which each prey item was present. Prey was identified and measured in the laboratory to lowest taxon possible (some prey items were identified to species while others were only identified to genus, family, order, etc.). Any prey with an among-year average occurrence of at least 5% are shown to the lowest taxonomic level; others are lumped together as "others" in their respective taxonomic group with values in bold showing totals for those taxa. Samples consist of regurgitations from adults returning to the colony to feed chicks (1975-1978, 1986-2017) and gular pouch contents from adults collected at or near the colony (1984). No diet samples were collected in 1979-1983, 1985, 1987-1988, 1990-1995, 1999, or 2002. More detailed diet data and prey identifications are available, contact refuge biologists for details.

Samples consist of regurgitations from adults returning to the colony to feed chicks (1975-1978, 1986-2017) and gular pouch contents from adults collected at or near the colony (1984). No diet samples were collected in 1979-1983, 1985, 1987-1988, 1990-1995, 1999, or 2002. More detailed diet data and prey identifications are available, contact refuge biologists for details.

Table 29 (continued). Frequency of occurrence of major prey items in diets of least auklet chicks at St. Paul Island, Alaska. Frequency is expressed as the percentage of food samples in which each prey item was present. Prey was identified and measured in the laboratory to lowest taxon possible (some prey items were identified to species while others were only identified to genus, family, order, etc.). Any prey with an among-year average occurrence of at least 5% are shown to the lowest taxonomic level; others are lumped together as "others" in their respective taxonomic group with values in bold showing totals for those taxa. Samples consist of regurgitations from adults returning to the colony to feed chicks (1975-1978, 1986-2017) and gular pouch contents from adults collected at or near the colony (1984). No diet samples were collected in 1979-1983, 1985, 1987-1988, 1990-1995, 1999, or 2002. More detailed diet data and prey identifications are available, contact refuge biologists for details.

^aMost likely Cheiragonidae but recent changes in taxonomy of Atelecyclidae and Cheiragonidae makes historic identification not entirely certain.

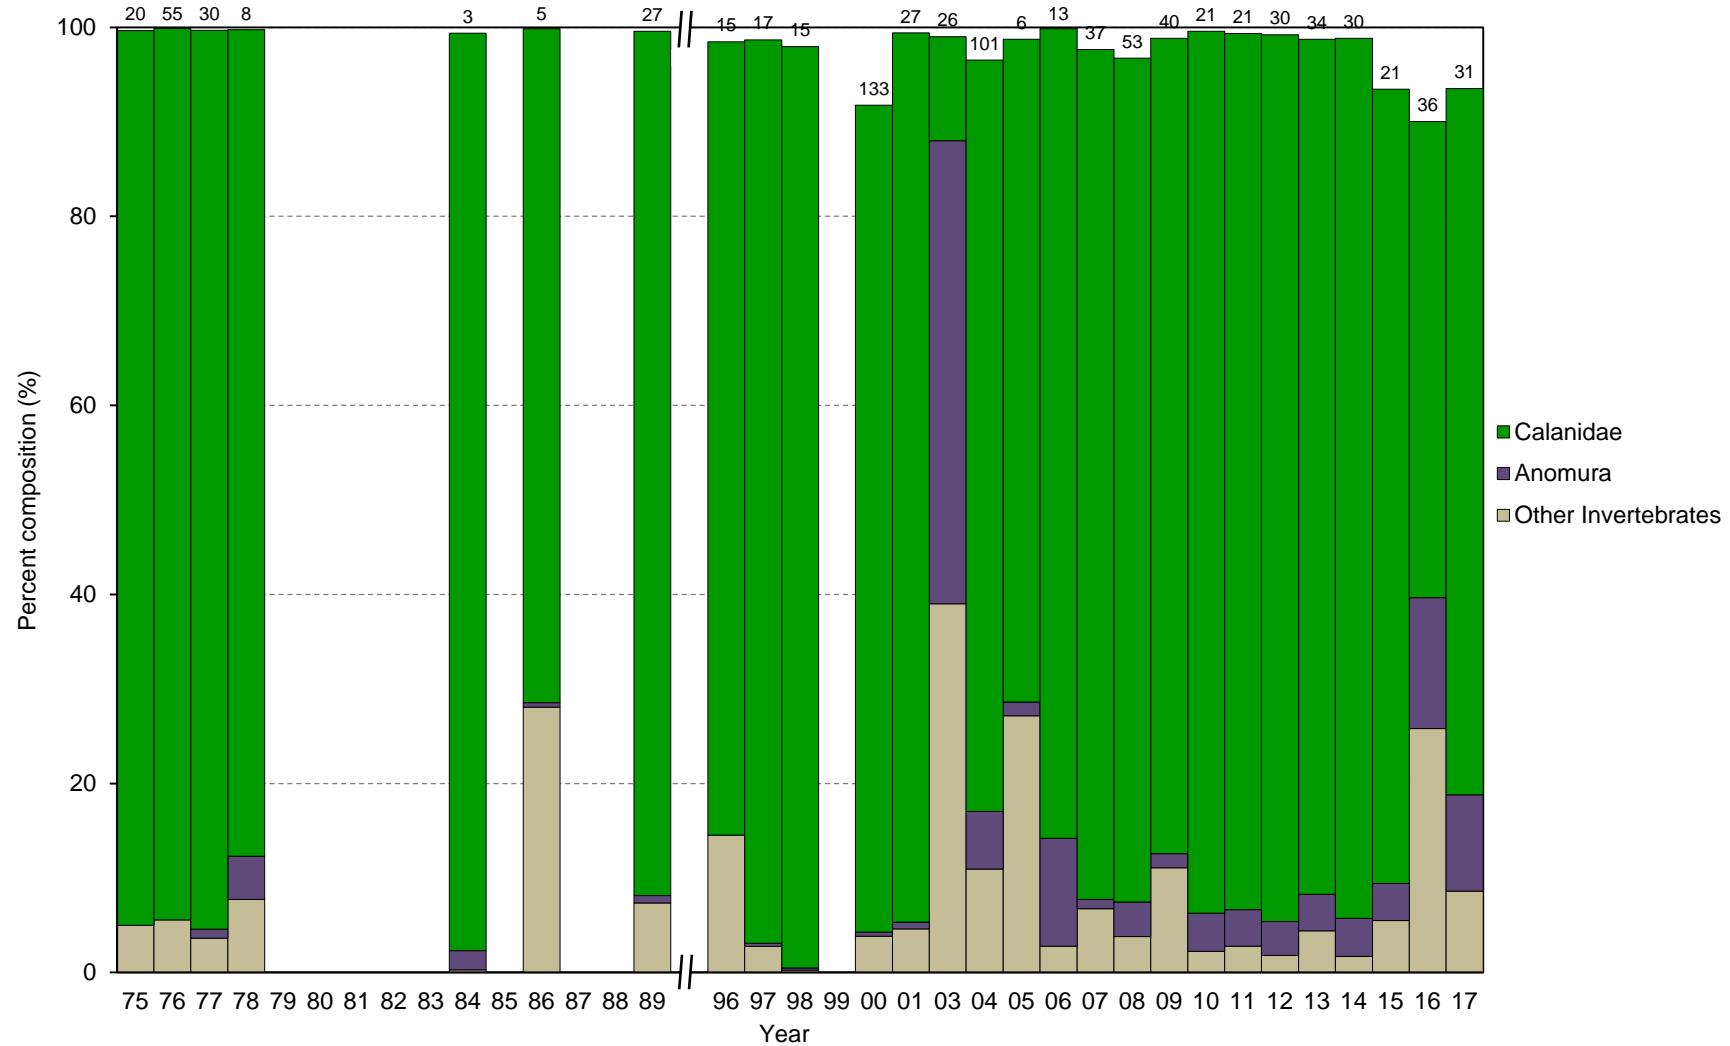

Figure 18. Percent composition of major prey items in diets of least auklet chicks at St. Paul Island, Alaska. Values are expressed as the percentage of total individual prey items comprised by each prey item. Prey is grouped to family level or higher; only taxa with an among-year average composition of at least 5% are shown. Samples consist of regurgitations from adults returning to the colony to feed chicks (1975-1978, 1986-2017) and gular pouch contents from adults collected at or near the colony (1984). Numbers above columns indicate sample sizes. No diet samples were collected in 1979-1983, 1985, 1987-1988, 1990-1995, 1999, or 2002.

Table 30. Percent composition of major prey items in diets of least auklet chicks at St. Paul Island, Alaska. Values are expressed as the percentage of total individual prey items comprised by each prey item (sums to 100% each year). Prey was identified and measured in the laboratory to lowest taxon possible (some prey items were identified to species while others were only identified to genus, family, order, etc.). Any prey with an among-year average composition of at least 5% are shown to the lowest taxonomic level; others are lumped together as "others" in their respective taxonomic group with values in bold showing totals for those taxa. Samples consist of regurgitations from adults returning to the colony to feed chicks (1975-1978, 1986-2016) and gular pouch contents from adults collected at or near the colony (1984). No diet samples were collected in 1979-1983, 1985, 1987-1988, 1990-1995, 1999, or 2002; samples were collected in 2017 but have not yet been analyzed. More detailed diet data and prey identifications are available, contact refuge biologists for details.

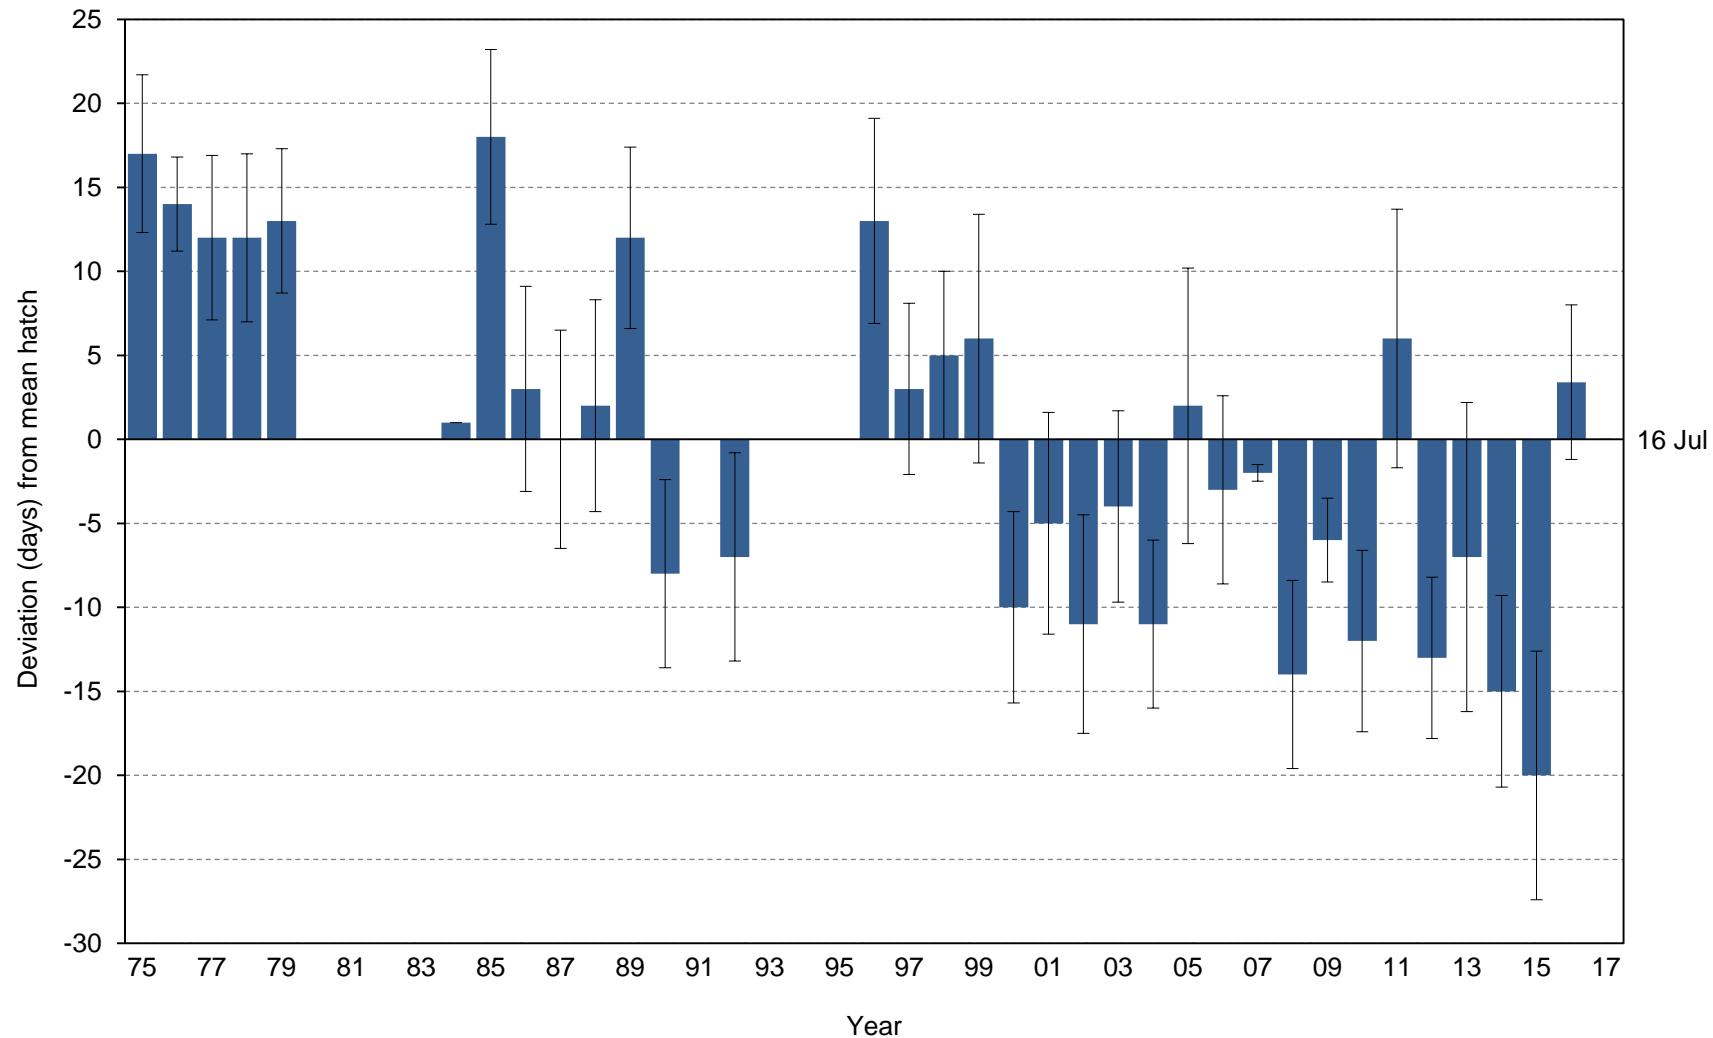

Figure 19. Yearly hatch date deviation (from the 1975-2016 average of 16 July) for black-legged kittiwakes at St. Paul Island, Alaska. Negative values indicate earlier than mean hatch date, positive values indicate later than mean hatch date. Error bars represent one standard deviation around each year's mean hatch date. No data were collected in 1980-1983, 1991, or 1993-1995; no eggs hatched in 2017.

Table 33. Breeding chronology of black-legged kittiwakes at St. Paul Island, Alaska. Data represent the dates of the first egg laid and the first chick hatched in each nest. No data were collected in 1980-1983, 1991, or 1993-1995.

^aSample sizes for mean lay dates are a sub-sample of total nests for which no egg to egg interval is ≤ 7 days.

^bSample sizes for mean hatch dates are a sub-sample of total nests for which egg-to-chick interval is ≤ 7 days.

^cIn years when no chicks fledged before the field crew left the island at the end of the season, date of first fledge is listed as > the date of last nest check.

^dxx indicates data potentially exist but have not yet been summarized.

Table 34. Frequency distribution of hatch dates for black-legged kittiwakes at St. Paul Island, Alaska. Data represent the date of the first chick hatched in each nest and include only nests in which observations of egg-to-chick ≤ 7 days. No data were collected in 1980-1983, 1991, or 1993-1995 and no eggs hatched in plots in 2017; data from individual nests are not available before 1984.

^aPlots that are combined for analysis are counted as a single "plot".

^bFor sampling clustered by plot, values are calculated based on plot as a sample unit; for simple random sampling, values are calculated using $\sqrt{\rho * (1 - \rho)}/n$, where ρ is the success rate and n is the sample size of individual nests.

^cStandard deviations are not calculated for success values that are midpoint estimates or based on unknown sample sizes or short-duration visits.

^dxx indicates data potentially exist but have not yet been summarized.

Table 37. Clutch sizes of black-legged kittiwakes at St. Paul Island, Alaska. Sample units consist of total nest sites, not plots. No data were collected in 1980-1983, 1991, or 1993-1995.

^aPlots were combined for statistical purposes.

^bStandard deviations are calculated based on plot as a sample unit.

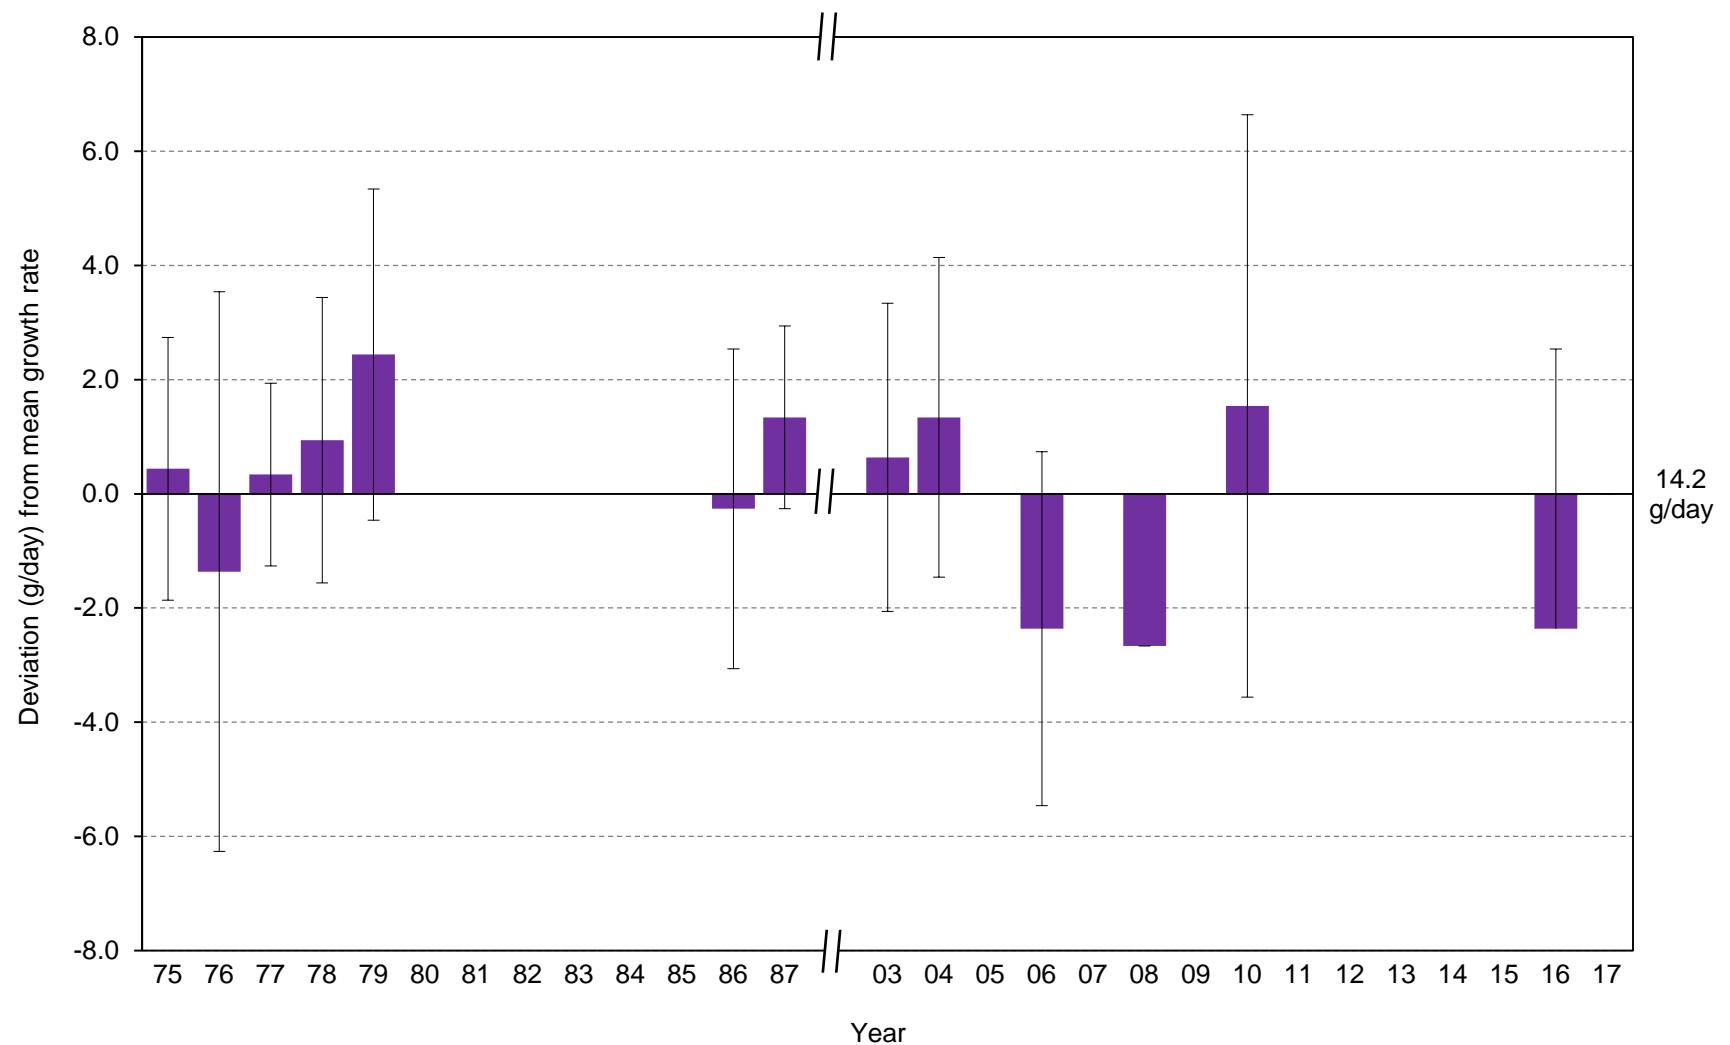

Figure 21. Yearly chick growth rate deviation (from the 1975-2016 average of 14.2 g/day) for black-legged kittiwakes at St. Paul Island, Alaska. Negative values indicate less than the mean growth rate, positive values exceed the mean growth rate. Error bars represent one standard deviation around each year's mean growth rate. No chicks were measured in 1980-1985, 1988-2002, 2005, 2007, 2009, 2011-2015, or 2017.

Table 39. Mean growth rates of black-legged kittiwake chicks at St. Paul Island, Alaska. Data include chicks measured at least two times during the linear phase of growth. No chicks were measured in 1980-1985, 1988-2002, 2005, 2007, 2009, 2011-2015, or 2017.

Year	Mass (g/day)				Wing chord (mm/day)				Linear phase definition ^a
	Mean	SD	Range	n	Mean	SD	Range	n	
1975	14.6	2.3	-	34	-	-	-	-	A

2010	15.7	5.1	6.0-24.4	15	4.4	1.7	0.7-6.9	15	C
2016	11.8	4.9	2.8-18.2	9	2.5	0.9	0.5-3.5	9	C

^aA=linear growth phase defined as period between initial and peak weight measurements of each chick; B=linear growth phase defined as period when chick age 5-25 days; C=chicks of unknown age, linear growth phase determined by visual inspection of individual growth curves.

^bxx indicates data potentially exist but have not yet been summarized.

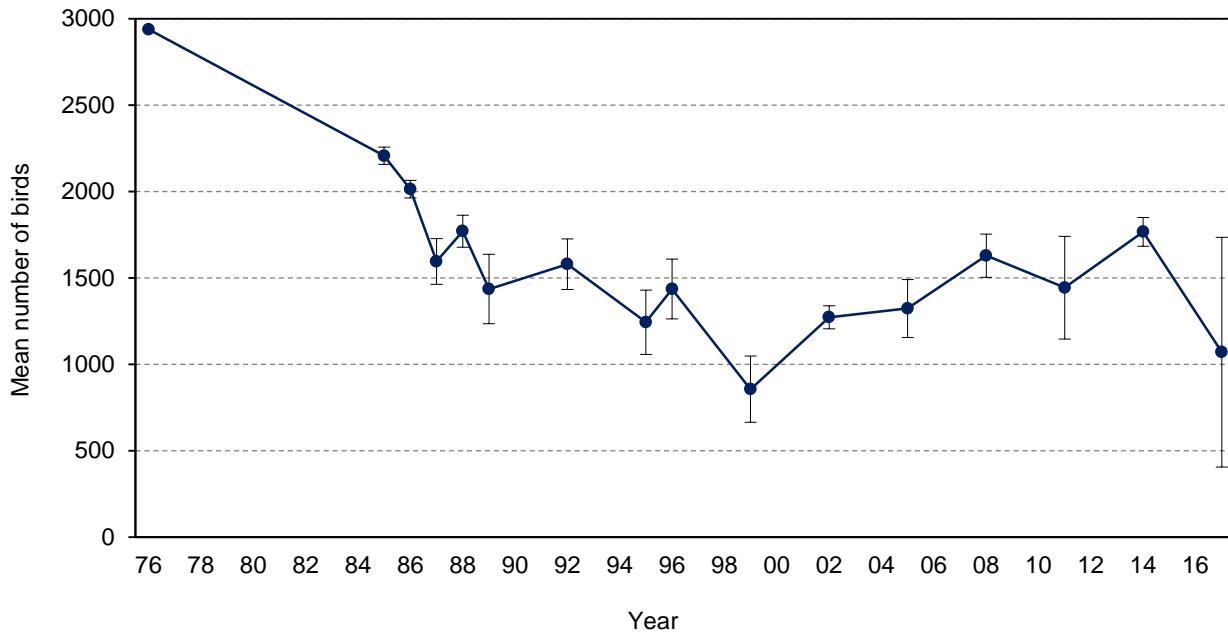

Figure 22. Mean numbers of black-legged kittiwakes counted on index plots at St. Paul Island, Alaska. Totals include all plots except 2ne, 6, 9, 16, 17, 19btm, 20btm, 21, 29, 29new, and 30. Error bars represent standard deviation. No counts were conducted in years not shown except 1982 and 1984 when data are excluded because not all plots were counted.

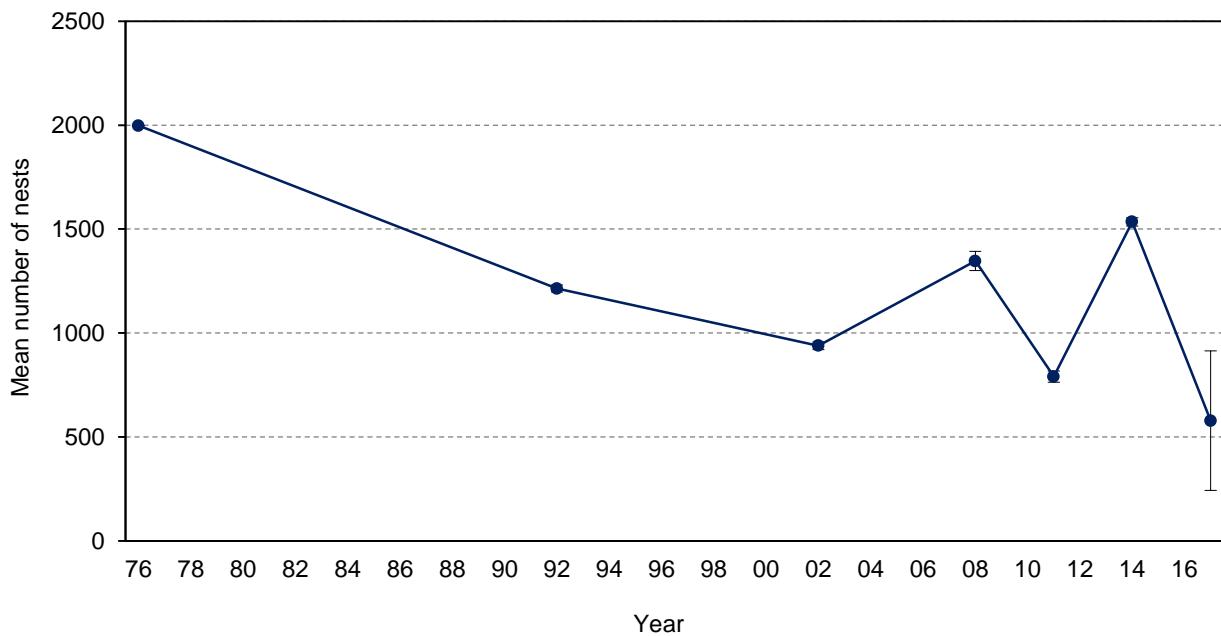

Figure 23. Mean numbers of black-legged kittiwake nests counted on index plots at St. Paul Island, Alaska. Totals include all plots except 2ne, 6, 9, 16, 17, 19btm, 20btm, 21, 29, 29new, and 30. Error bars represent standard deviation. No counts were conducted in years not shown except 1982 and 1984 when data are excluded because not all plots were counted; data potentially exist in 1985-1989, 1996, 1999, and 2005 but have not yet been summarized.

Table 40. Numbers of black-legged kittiwakes counted on index plots at St. Paul Island, Alaska. Totals include all plots except 2ne, 6, 9, 16, 17, 19btm, 20btm, 21, 29, 29new, and 30. No counts were conducted in years not listed except 1982 and 1984 when data are excluded because not all plots were counted.

<hr/>											
Resighting effort ^d											
Total no. resight days		16	14	15	10	8	19	35	35	37	-
Total no. resight hours		N/A ^e	46.0	16.1	8.3	6.0	17.6	17.7	25.9	30.2	-

^aBirds banded in current year are not resighted until following year and not included in current year totals.

^bValue equals the sum of birds resighted in prior year + birds not resighted in prior year but resighted in future years and thus known to have been alive in prior year + new birds banded in prior year.

^cSurvival should be considered a minimum estimate because it is likely not all birds present were observed each year.

^dResighting effort represents sum of time spent at survival plots and includes only dedicated resighting time, not incidental observations made during other work. Hours are calculated by people-hours: 2 people resighting for 1 hour each = 2 resight hours.

^eN/A indicates total resight hours not recorded.

Table 46. Resight history of adult black-legged kittiwakes banded on survival plots at St. Paul Island, Alaska. Data include birds banded with alphanumeric color bands and three color band combinations (2008 only) but not birds historically banded with color combinations 1970-1990's. Values represent number of times birds were resighted each year. Color codes are recorded as color and # of band for birds banded with alphanumeric color bands, and as colors (in code) of bands on left (L) and right (R) legs for birds banded with three band combinations.

Codes: Color combos DB = dark blue DG = dark green O = orange				Location SW = Southwest Pt. TS = Tsamana TN = Tsamana North			Resight history 0 = not resighted x = band no longer resightable (dead, removed, etc.)

Table 46 (continued). Resight history of adult black-legged kittiwakes banded on survival plots at St. Paul Island, Alaska. Data include birds banded with alphanumeric color bands and three color band combinations (2008 only) but not birds historically banded with color combinations 1970-1990's. Values represent number of times birds were resighted each year. Color codes are recorded as color and # of band for birds banded with alphanumeric color bands, and as colors (in code) of bands on left (L) and right (R) legs for birds banded with three band combinations.

Codes: Color combos			Location			Resight history									
DB = dark blue	R = red	Y = yellow	SW = Southwest Pt.	TS = Tsamana	TN = Tsamana North	O = not resighted	x = band no longer resightable (dead, removed, etc.)

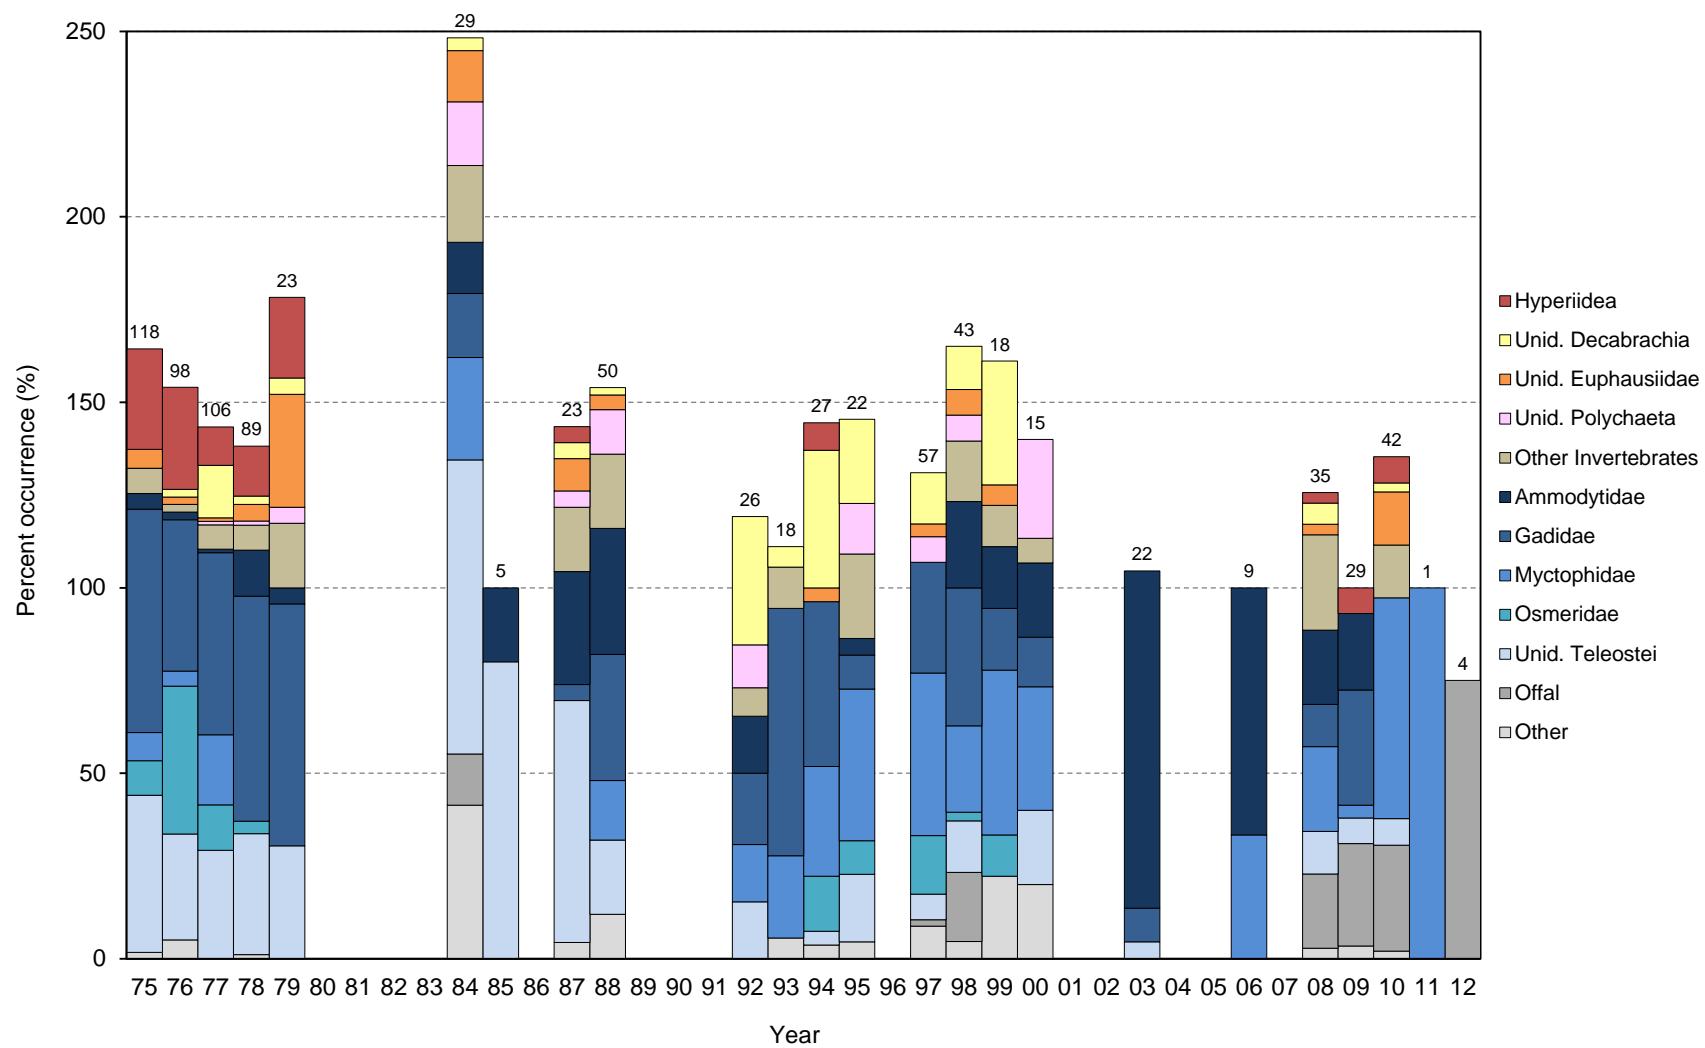

Figure 24. Frequency of occurrence of major prey items in diets of black-legged kittiwake adults and chicks at St. Paul Island, Alaska. Frequency is expressed as the percentage of food samples in which each prey item was present. Prey is grouped to family level or higher; only taxa with an among-year average occurrence of at least 5% are shown. Samples consist of stomach contents from adults and chicks collected at or near the colony, regurgitations from adults returning to the colony to feed chicks, as well as regurgitations from chicks themselves. Numbers above columns indicate sample sizes. No diet samples were collected in 1980-1983, 1986, 1989-1991, 1996, 2001-2002, 2004-2005, 2007, 2013-2015, or 2017; samples were collected in 2016 but have not yet been analyzed.

Table 47. Frequency of occurrence of major prey items in diets of black-legged kittiwake adults and chicks at St. Paul Island, Alaska. Frequency is expressed as the percentage of food samples in which each prey item was present. Prey was identified and measured in the laboratory to lowest taxon possible (some prey items were identified to species while others were only identified to genus, family, order, etc.). Any prey with an among-year average occurrence of at least 5% are shown to the lowest taxonomic level; others are lumped together as "others" in their respective taxonomic group with values in bold showing totals for those taxa. Samples consist of stomach contents from adults and chicks collected at or near the colony, regurgitations from adults returning to the colony to feed chicks, as well as regurgitations from chicks themselves. No diet samples were collected in 1980-1983, 1986, 1989-1991, 1996, 2001-2002, 2004-2005, 2007, 2013-2015, or 2017; samples were collected in 2016 but have not yet been analyzed. More detailed diet data and prey identifications are available, contact refuge biologists for details.

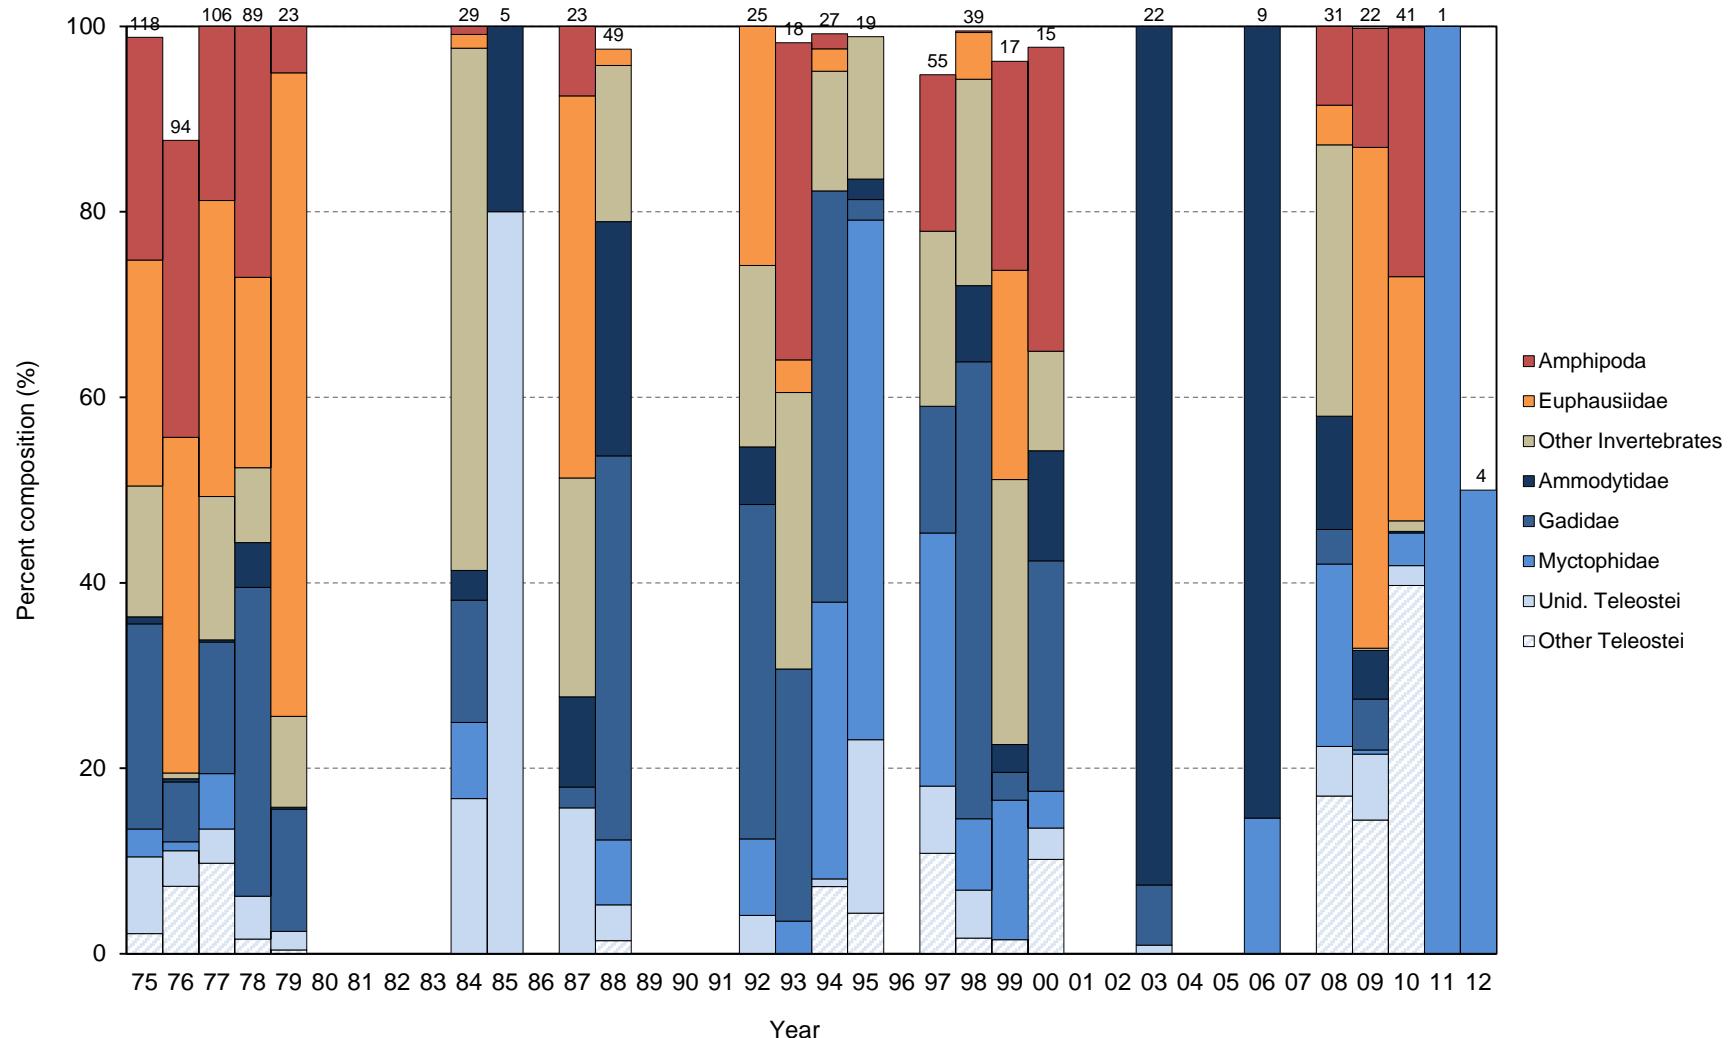

Figure 25. Percent composition of major prey items in diets of black-legged kittiwake adults and chicks at St. Paul Island, Alaska. Values are expressed as the percentage of total individual prey items comprised by each prey item. Prey is grouped to family level or higher; only taxa with an among-year average composition of at least 5% are shown. Samples consist of regurgitations and boluses from adults returning to the colony to feed chicks, as well as regurgitations from chicks themselves. Numbers above columns indicate sample sizes. No diet samples were collected in 1980-1983, 1986, 1989-1991, 1996, 2001-2002, 2004-2005, 2007, 2013-2015, or 2017; samples were collected in 2016 but have not yet been analyzed.

Table 48. Percent composition of major prey items in diets of black-legged kittiwake adults and chicks at St. Paul Island, Alaska. Values are expressed as the percentage of total individual prey items comprised by each prey item (sums to 100% each year). Prey was identified and measured in the laboratory to lowest taxon possible (some prey items were identified to species while others were only identified to genus, family, order, etc.). Any prey with an among-year average composition of at least 5% are shown to the lowest taxonomic level; others are lumped together as "others" in their respective taxonomic group with values in bold showing totals for those taxa. Samples consist of stomach contents from adults and chicks collected at or near the colony, regurgitations from adults returning to the colony to feed chicks, as well as regurgitations from chicks themselves. No diet samples were collected in 1980-1983, 1986, 1989-1991, 1996, 2001-2002, 2004-2005, 2007, 2013-2015, or 2017; samples were collected in 2016 but have not yet been analyzed. More detailed diet data and prey identifications are available, contact refuge biologists for details.

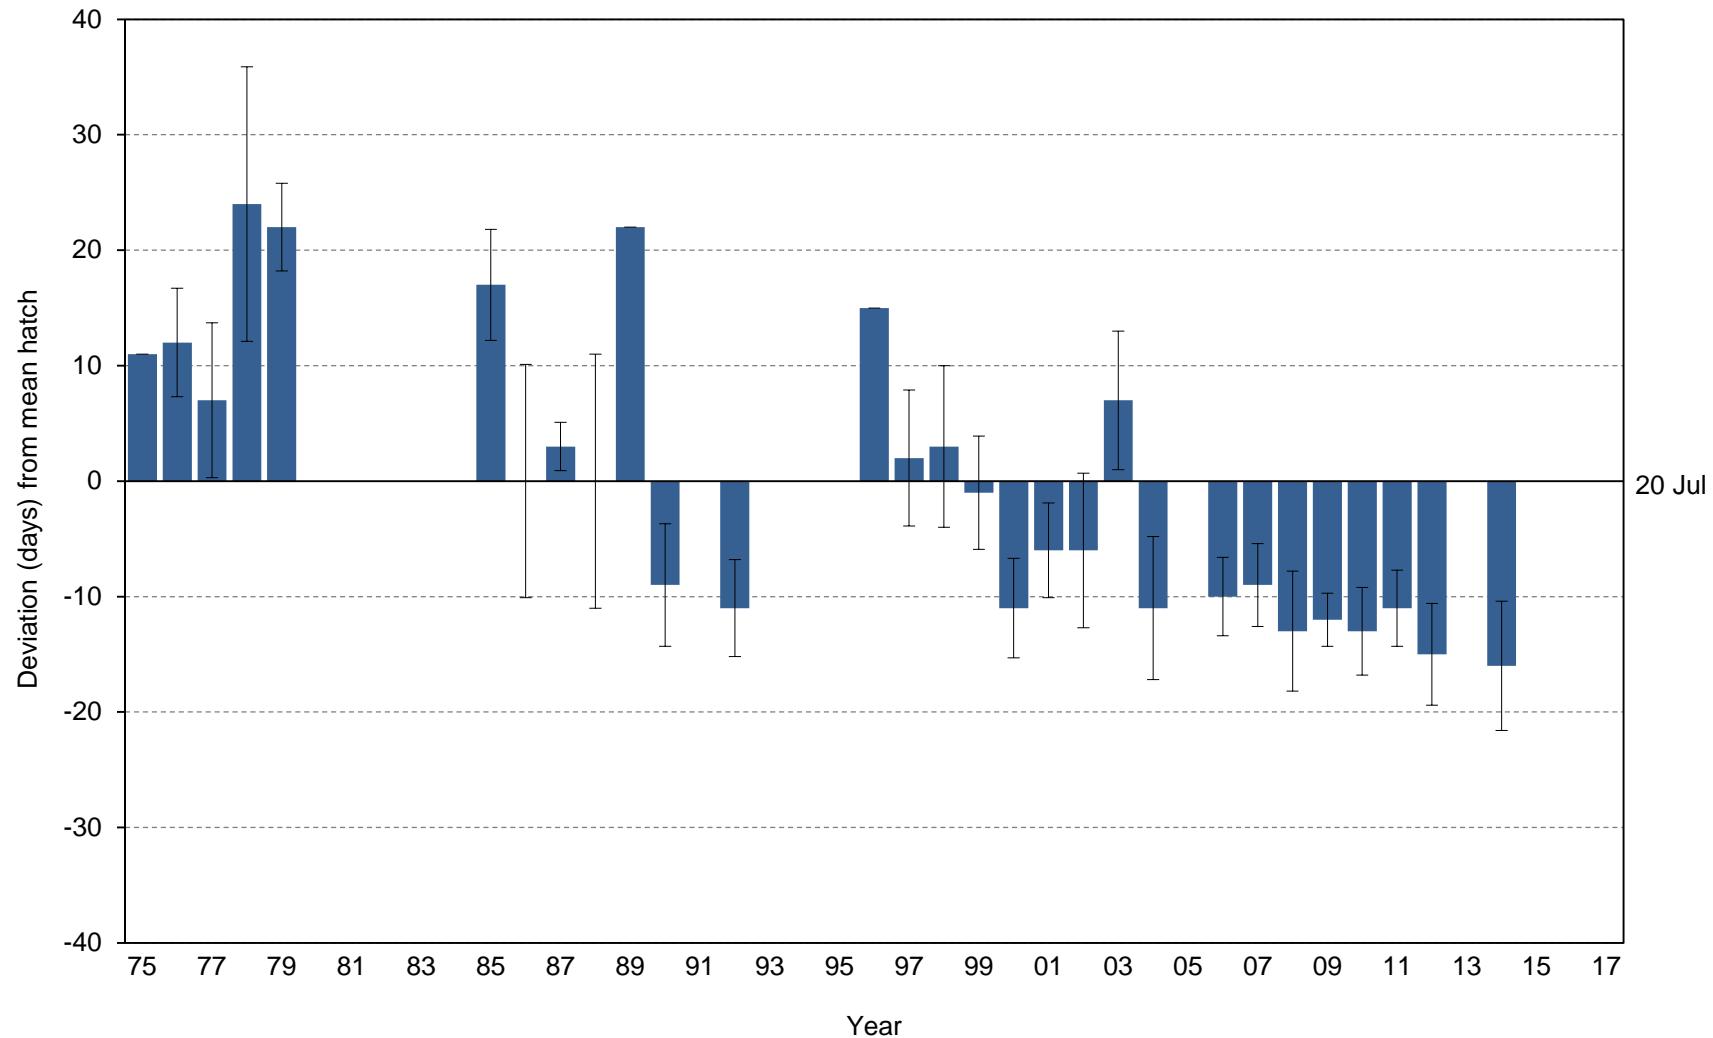

Figure 26. Yearly hatch date deviation (from the 1975-2016 average of 20 July) for red-legged kittiwakes at St. Paul Island, Alaska. Negative values indicate earlier than mean hatch date, positive values indicate later than mean hatch date. Error bars represent one standard deviation around each year's mean hatch date. No data were collected in 1980-1984, 1991, 1993-1995, or 2013; no eggs hatched in plots in 2005 or 2015-2017.

Table 49. Breeding chronology of red-legged kittiwakes at St. Paul Island, Alaska. Data represent the dates of the first egg laid and the first chick hatched in each nest. No data were collected in 1980-1984, 1991, or 1993-1995.

^aSample sizes for mean lay dates are a sub-sample of total nests for which no egg to egg interval is ≤ 7 days.

^bSample sizes for mean hatch dates are a sub-sample of total nests for which egg-to-chick interval is ≤ 7 days.

^cIn years when no chicks fledged before the field crew left the island at the end of the season, date of first fledge is listed as > the date of last nest check.

^dxx indicates data potentially exist but have not yet been summarized.

^eDue to extreme weather conditions, hatch dates were not obtained in 2013.

Table 50. Frequency distribution of hatch dates for red-legged kittiwakes at St. Paul Island, Alaska. Data represent the date of the first chick hatched in each nest and include only nests in which observations of egg-to-chick \leq 7 days. No data were collected in 1980-1984, 1991, 1993-1995, or 2013; data from individual nests are not available before 1985 and no eggs hatched in plots in 2005 or 2015-2017.

^aPlots that are combined for analysis are counted as a single "plot".

^bFor sampling clustered by plot, values are calculated based on plot as a sample unit; for simple random sampling, values are calculated using $\sqrt{p * (1 - p)}/n$, where p is the success rate and n is the sample size of individual nests.

^cStandard deviations are not calculated for success values that are midpoint estimates or based on short-duration visits.

^dxx indicates data potentially exist but have not yet been summarized.

Table 53. Clutch sizes of red-legged kittiwakes at St. Paul Island, Alaska. Sample units consist of total nest sites, not plots. No data were collected in 1980-1983, 1991, or 1993-1995.

Productivity (F/A)	0.00	0.00	0.00	0.00	0.00	0.00

^aDue to small sample sizes per plot, standard deviations are calculated based on simple random sampling rather than cluster sampling with ratio estimator spreadsheets. For simple random sampling, values are calculated using $\sqrt{\rho * (1 - \rho)/n}$, where ρ is the success rate and n is the sample size of individual nests.

Table 55. Reproductive performance of red-legged kittiwakes at SW Point and Ridgewall colonies, St. Paul Island, Alaska in 2017, as determined by a Boom-or-Bust methodology.

^aNumbers of chicks may represent a minimum count as not all may have been visible.

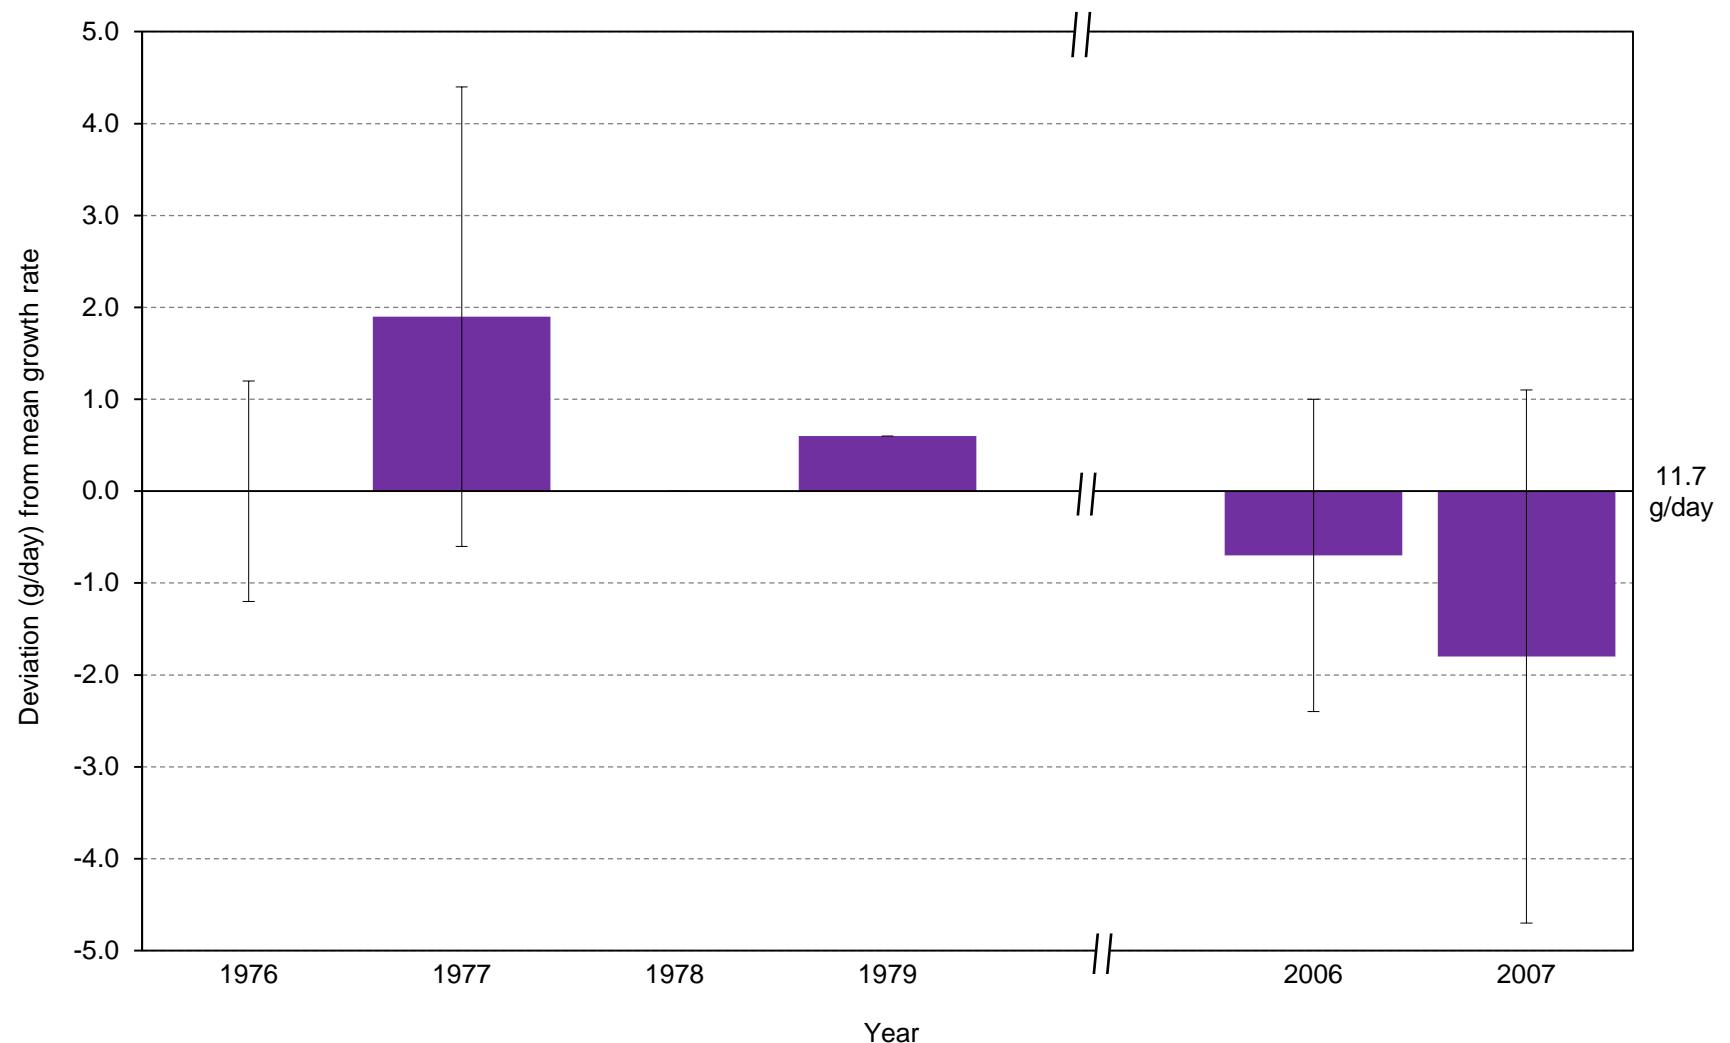

Figure 28. Yearly chick growth rate deviation (from the 1976-2007 average of 11.7 g/day) for red-legged kittiwakes at St. Paul Island, Alaska. Negative values indicate less than the mean growth rate, positive values exceed the mean growth rate. Error bars represent one standard deviation around each year's mean growth rate. No chicks were measured in 1978, 1980-2005, or after 2007.

Table 56. Mean growth rates of red-legged kittiwake chicks at St. Paul Island, Alaska. Data include chicks measured at least two times during the linear phase of growth. No chicks were measured in 1978, 1980-2005, or after 2007.

Year	Mass (g/day)				Wing chord (mm/day)				Linear phase definition ^a
	Mean	SD	Range	n	Mean	SD	Range	n	
1976	11.7	1.2	-	4	-	-	-	-	A
1977	13.6	2.5	-	3	-	-	-	-	A
1979	12.3	-	-	1	-	-	-	-	A
2006	11.0	1.7	9.7-12.9	3	5.2	1.3	3.8-6.0	3	C
2007	9.9	2.9	5.3-13.2	4	3.5	1.3	1.3-4.5	4	C

^aA=linear growth phase defined as period between initial and peak weight measurements of each chick; C=chicks of unknown age, linear growth phase determined by visual inspection of individual growth curves.

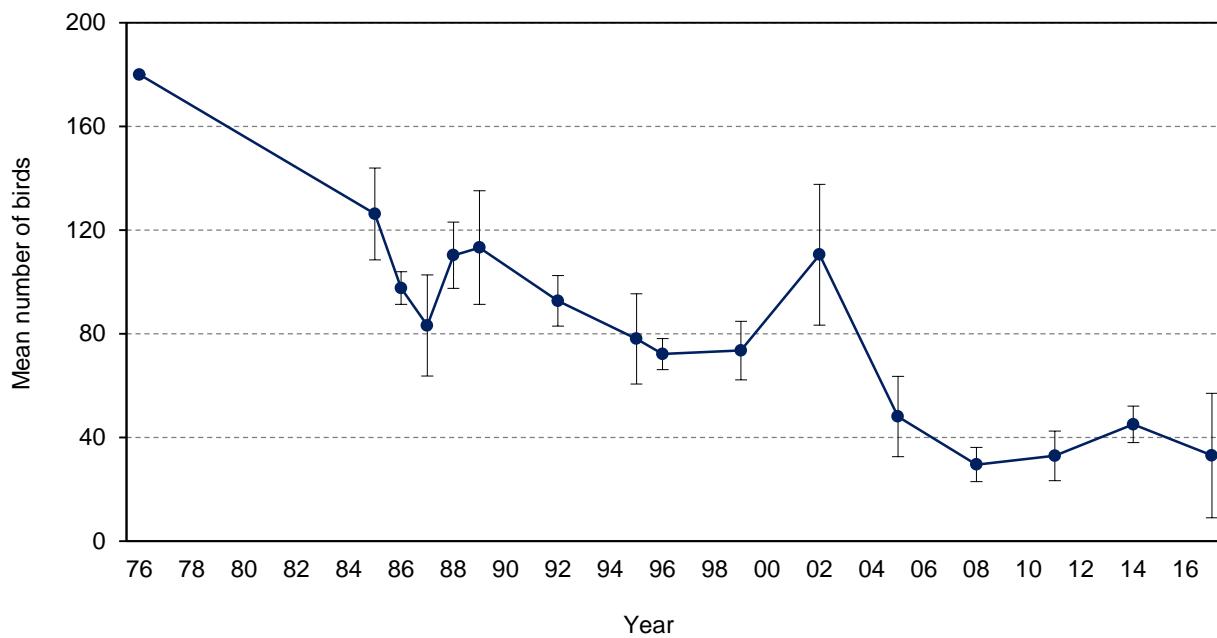

Figure 29. Mean numbers of red-legged kittiwakes counted on index plots at St. Paul Island, Alaska. Totals include all plots except 2ne, 6, 9, 16, 17, 19btm, 20btm, 21, 29, 29new, and 30. Error bars represent standard deviation. No counts were conducted in years not shown except 1982 and 1984 when data are excluded because not all plots were counted.

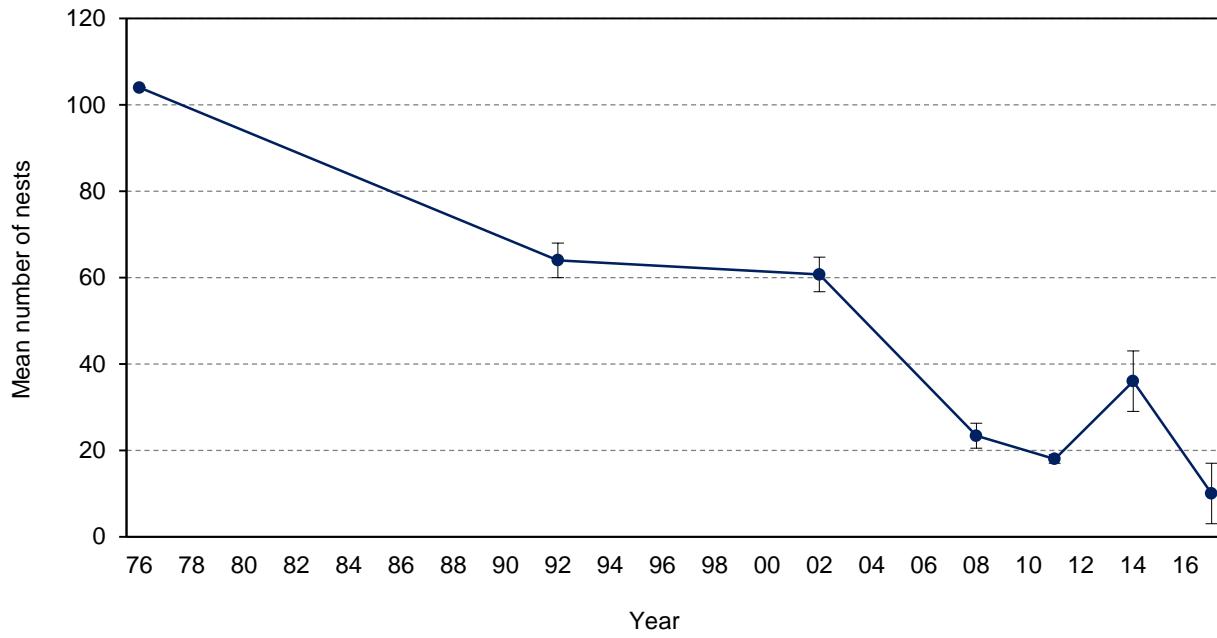

Figure 30. Mean numbers of red-legged kittiwake nests counted on index plots at St. Paul Island, Alaska. Totals include all plots except 2ne, 6, 9, 16, 17, 19btm, 20btm, 21, 29, 29new, and 30. Error bars represent standard deviation. No counts were conducted in years not shown except 1982 and 1984 when data are excluded because not all plots were counted; data potentially exist in 1985-1989, 1996, 1999, and 2005 but have not yet been summarized.

Table 57. Numbers of red-legged kittiwakes counted on index plots at St. Paul Island, Alaska. Totals include all plots except 2ne, 6, 9, 16, 17, 19btm, 20btm, 21, 29, 29new, and 30. No counts were conducted in years not listed except 1982 and 1984 when data are excluded because not all plots were counted.

^aDoes not include the segment called Reef. Reef had 13 red-legged kittiwakes in the 2015 counts.

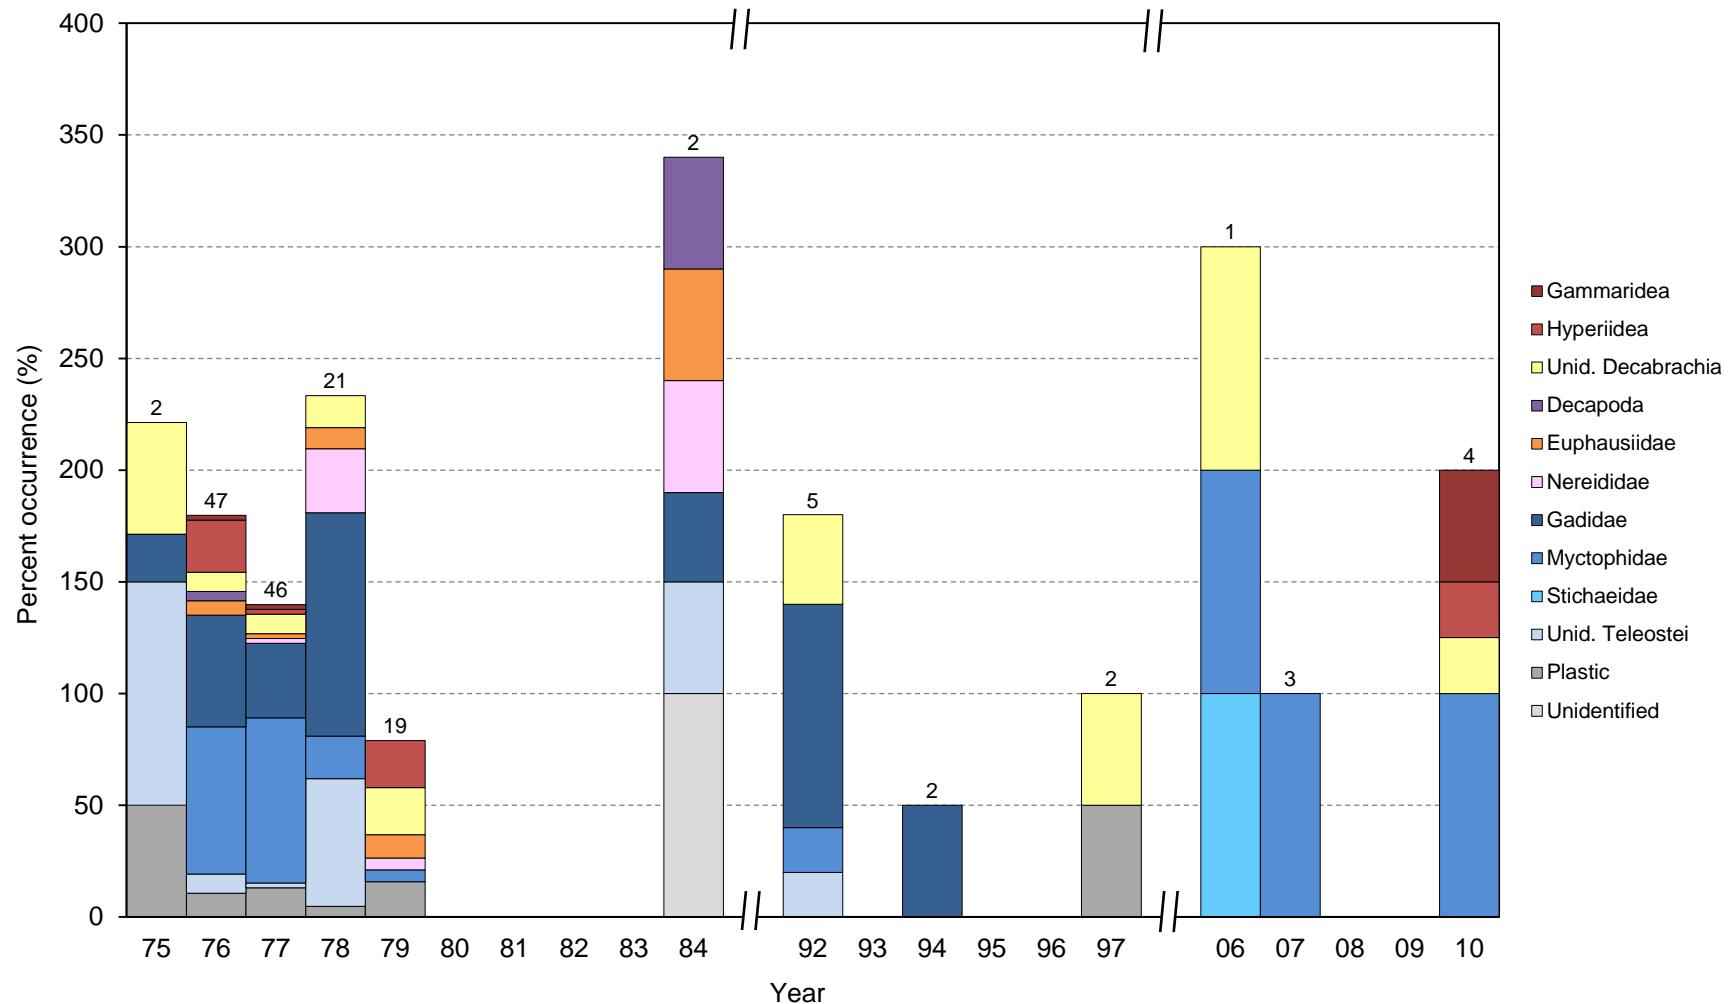

Figure 31. Frequency of occurrence of major prey items in diets of red-legged kittiwake adults and chicks at St. Paul Island, Alaska. Frequency is expressed as the percentage of food samples in which each prey item was present. Only prey with an among-year average occurrence of at least 5% are shown. Samples consist of stomach contents from adults collected at or near the colony, regurgitations from adults returning to the colony to feed chicks, as well as regurgitations from chicks themselves. Numbers above columns indicate sample sizes. No diet samples were collected in 1980-1983, 1985-1991, 1993, 1995-1996, 1998-2005, 2008-2009, or after 2010.

Table 62. Frequency of occurrence of major prey items in diets of red-legged kittiwake adults and chicks at St. Paul Island, Alaska. Frequency is expressed as the percentage of food samples in which each prey item was present. Prey was identified and measured in the laboratory to lowest taxon possible (some prey items were identified to species while others were only identified to genus, family, order, etc.). Any prey with an among-year average occurrence of at least 5% are shown to the lowest taxonomic level; others are lumped together as "others" in their respective taxonomic group with values in bold showing totals for those taxa. Samples consist of stomach contents from adults collected at or near the colony, regurgitations from adults returning to the colony to feed chicks, as well as regurgitations from chicks themselves. No diet samples were collected in 1980-1983, 1985-1991, 1993, 1995-1996, 1998-2005, 2008-2009, or after 2010. More detailed diet data and prey identifications are available, contact refuge biologists for details.

^aChicks are usually quite large when they are first seen and this date does not correspond to a hatch date.

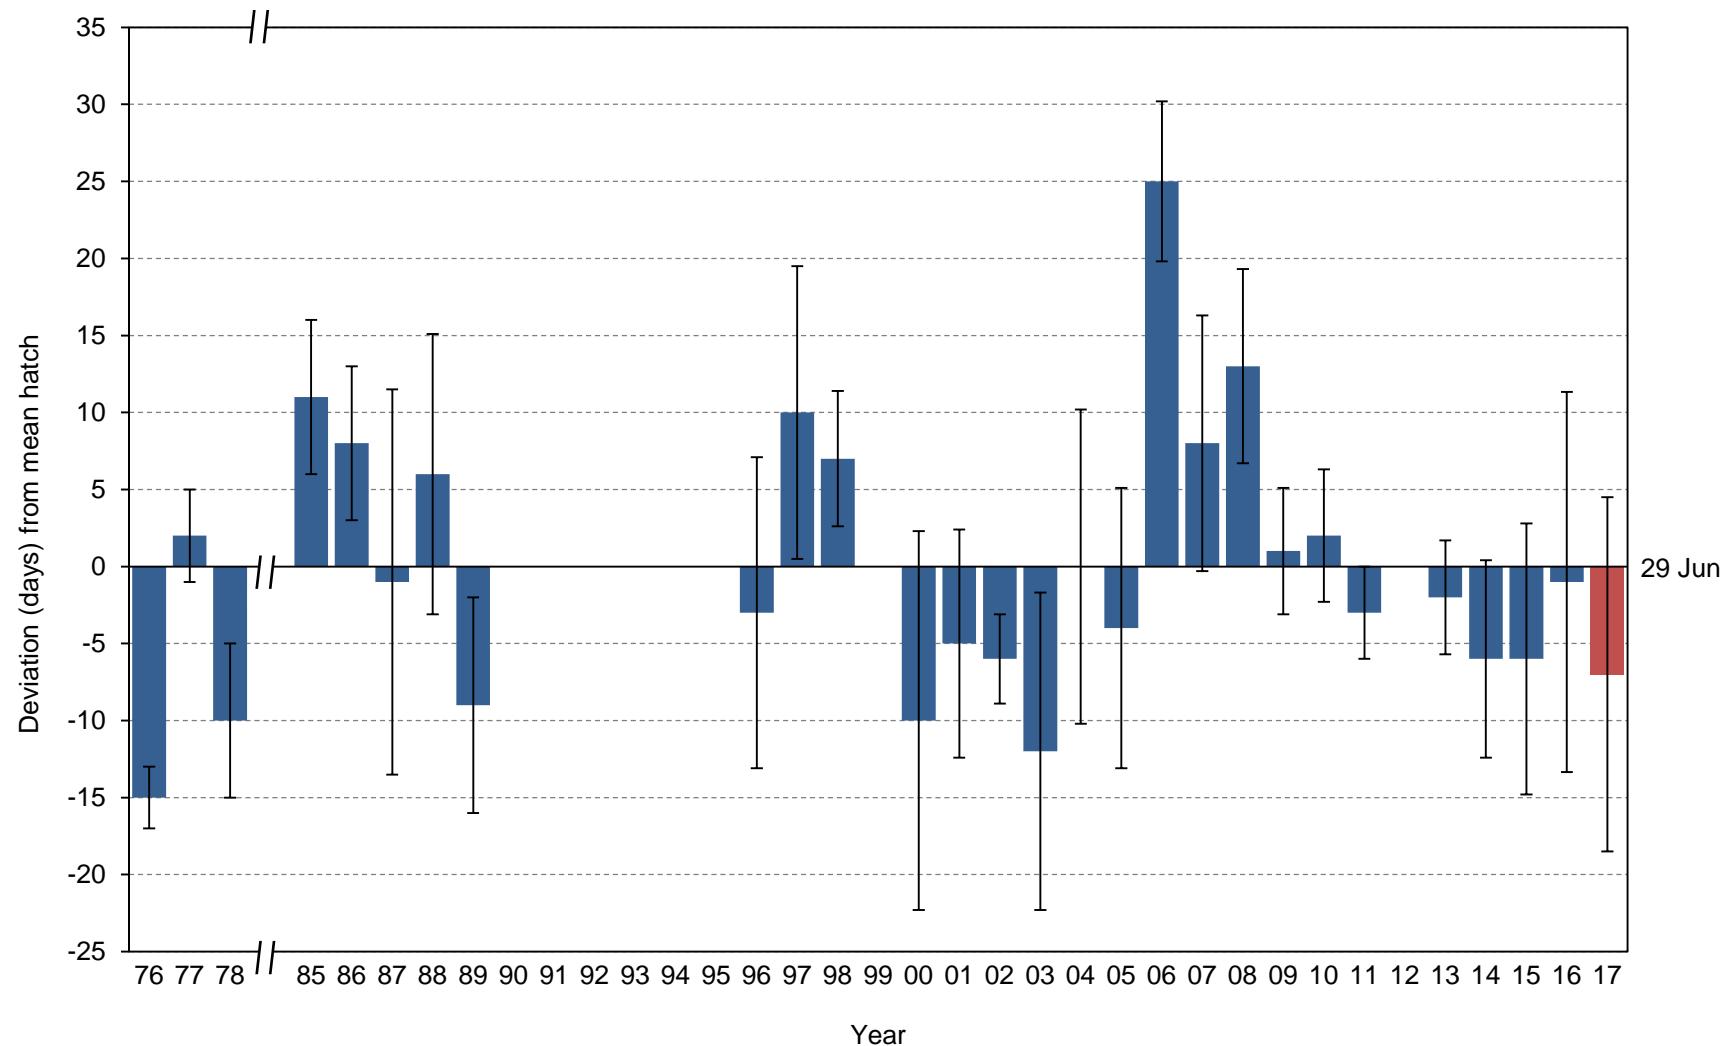

Figure 34. Yearly hatch date deviation (from the 1976-2016 average of 29 June) for red-faced cormorants at St. Paul Island, Alaska. Negative values indicate earlier than mean hatch date, positive values indicate later than mean hatch date. Error bars represent one standard deviation around each year's mean hatch date; red highlights the current year. No data were collected in 1979-1984, 1990-1995, 1999, or 2012.

Table 67. Breeding chronology of red-faced cormorants at St. Paul Island, Alaska. Data represent the date of the first chick hatched in each nest. No data were collected in 1979-1984, 1990-1995, 1999, or 2012.

^aSample sizes for mean hatch dates are a sub-sample of total nests for which egg-to-chick interval is ≤ 7 days.

^bData available only as range (Hunt et al. 1981).

Table 68. Frequency distribution of hatch dates for red-faced cormorants at St. Paul Island, Alaska. Data represent the date of the first chick hatched in each nest and include only nests in which observations of egg-to-chick ≤ 7 days. No data were collected in 1979-1984, 1990-1995, 1999, or 2012; data from individual nests are not available before 1987.

Productivity (F/A)	0.93	0.86	0.38	0.60	0.71	0.25

^aStandard deviations are calculated based on plot as a sample unit.

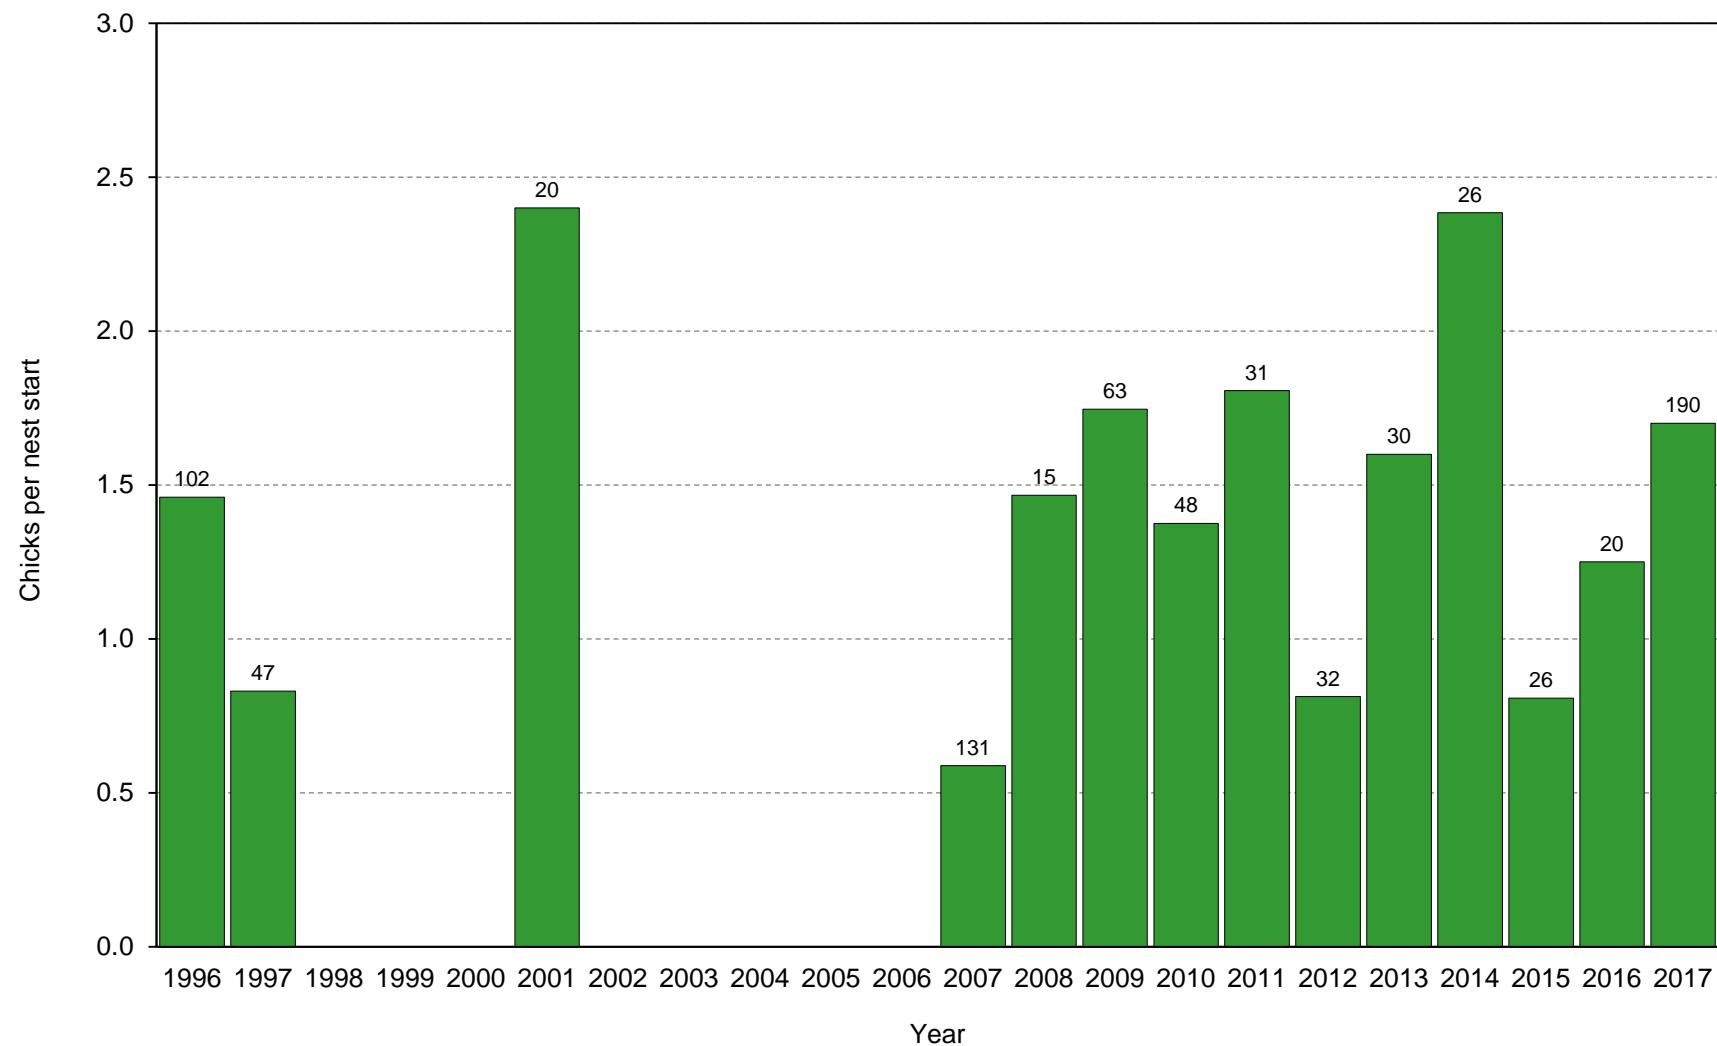

Figure 36. Reproductive performance of red-faced cormorants at St. Paul Island, Alaska, as determined by a Boom-or-Bust methodology. Success is measured by the number of chicks per nest start (E/A), where E =total chicks and A =total nest starts (including those without chicks). Numbers above columns indicate sample sizes (A). No data were collected in 1998-2000 or 2002-2006.

Table 71. Reproductive performance of red-faced cormorants at St. Paul Island, Alaska, as determined by a Boom-or-Bust methodology. Measures of success are based on a count of nests (or maximum of several counts) conducted early in the nesting period and a count of large chicks (or maximum of several counts) conducted late in the nesting period. No data were collected in 1998-2000 or 2002-2006.

Year	Total nest starts (A)	Nest sites w/ x chicks ^a :					Nest sites w/ chicks (D)	Total chicks (E)	Mean brood size (E/D)	Prop. nest sites w/ chicks (D/A) ^b	Chicks/nest start (E/A) ^b	Date(s) of nest count	Date(s) of chick count

^aNumbers of chicks may represent a minimum count as not all may have been visible.

^bProportion of nest sites with chicks (D/A) and chicks/nest start (E/A) may be considered maximum potential values of productivity (F/A) and fledglings/nest start (G/A), respectively, based on the assumption that all chicks counted eventually fledge.

^cxx indicates data potentially exist but have not yet been summarized.

Table 72. Reproductive performance of red-faced cormorants at Water Towers, Black Bluffs, SW Point, and Tsamana colonies, St. Paul Island, Alaska in 2017, as determined by a Boom-or-Bust methodology. Chicks were counted only during the final three counts.

Table 80. Fates of cohorts of red-faced cormorants banded as chicks on banding plot at St. Paul Island, Alaska. Data represent fidelity of chicks to the plot from where they fledged and not survival because red-faced cormorants typically move among plots and islands each year. Resights are based on incidental observations only and not a standardized resighting effort. Values in parentheses indicate observations of immature birds and not those of breeding age.

Table 81 (continued). Resight history of red-faced cormorants banded as chicks on banding plot at St. Paul Island, Alaska. Data represent number of times birds were resighted each year. Resights are based on incidental observations only and not a standardized resighting effort. Values in parentheses indicate observations of immature birds and not those of breeding age.

Table 81 (continued). Resight history of red-faced cormorants banded as chicks on banding plot at St. Paul Island, Alaska. Data represent number of times birds were resighted each year. Resights are based on incidental observations only and not a standardized resighting effort. Values in parentheses indicate observations of immature birds and not those of breeding age.

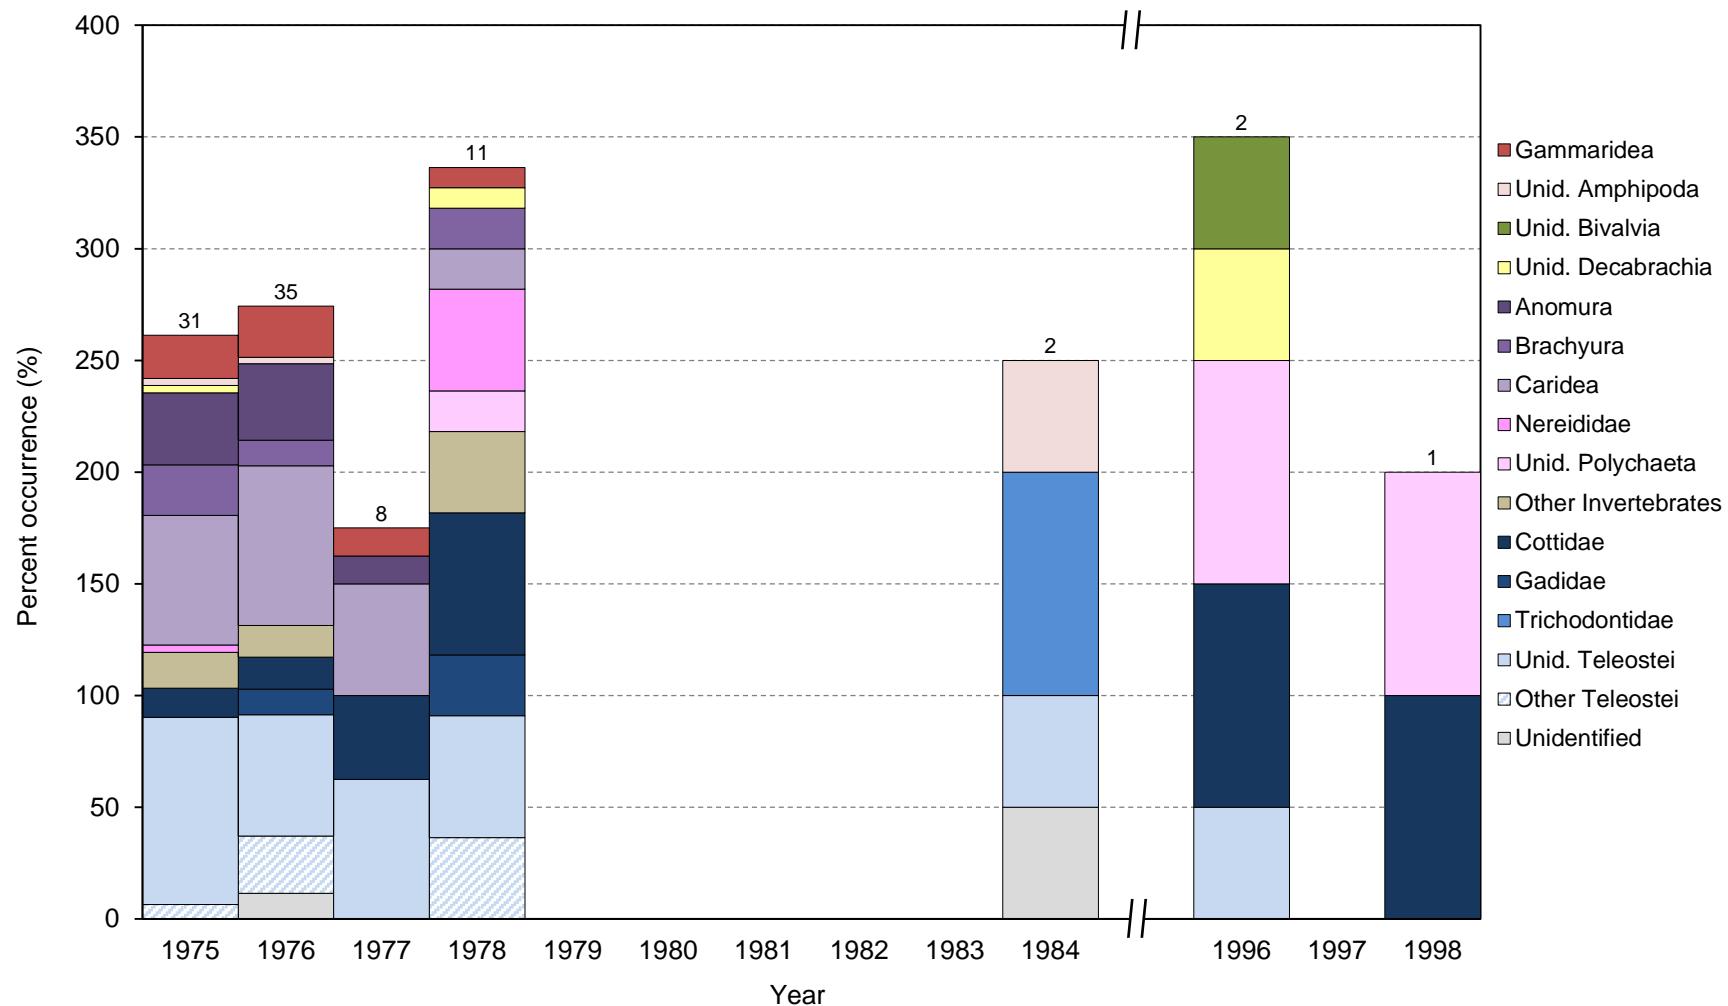

Figure 39. Frequency of occurrence of major prey items in diets of red-faced cormorant chicks at St. Paul Island, Alaska. Frequency is expressed as the percentage of food samples in which each prey item was present. Prey is grouped to family level or higher; only taxa with an among-year average occurrence of at least 5% are shown. Samples consist of regurgitations and boluses from adults returning to the colony to feed chicks, as well as regurgitations from chicks themselves. Numbers above columns indicate sample sizes. No diet samples were collected in 1979-1983, 1985-1995, 1997, or 1999-2008; samples were collected in 2009-2017 but have not yet been analyzed.

Table 83. Frequency of occurrence of major prey items in diets of red-faced cormorant chicks at St. Paul Island, Alaska. Frequency is expressed as the percentage of food samples in which each prey item was present. Prey was identified and measured in the laboratory to lowest taxon possible (some prey items were identified to species while others were only identified to genus, family, order, etc.). Any prey with an among-year average occurrence of at least 5% are shown to the lowest taxonomic level; others are lumped together as "others" in their respective taxonomic group with values in bold showing totals for those taxa. Samples consist of regurgitations and boluses from adults returning to the colony to feed chicks, as well as regurgitations from chicks themselves. No diet samples were collected in 1979-1983, 1985-1995, 1997, or 1999-2008; samples were collected in 2009-2017 but have not yet been analyzed. More detailed diet data and prey identifications are available, contact refuge biologists for details.

Abundance categories were defined as follows:

Abundant: annual, sure to see many
Common: annual, sure to see some
Uncommon: annual, likely to see some
Rare: annual but not guaranteed to see any
Irregular: not annual but numerous records
Casual: not annual, only a few records
Accidental: only one or two records ever

Status categories are defined as follows:

Breeder: evidence breeding, either confirmed (observations of current nests, eggs, or chicks; adults carrying nesting materials or food to nests or chicks; recently fledged young; distraction displays) or probably (observations of pairs or territorial behavior)
Resident non-breeder: occurs throughout season but does not breed at site
Migrant: through-migrant, recorded regularly but only during migratory period
Vagrant: recorded outside known breeding, wintering, and migrating range (category added in 2012)

BIRDS

Greater white-fronted goose (*Anser albifrons*). Uncommon migrant. A single individual was seen periodically during the first half of June near Antone Lake

Aleutian cackling goose (*Branta hutchinsii leucopareia*). Uncommon migrant. A group of 45 individuals was seen flying over Ridgewall on 12 June.

Eurasian wigeon (*Anas penelope*). Uncommon migrant. Two individuals were seen on Antone Lake at the end of May.

American wigeon (*Anas americana*). Irregular migrant. Single individuals were seen on Antone Lake throughout June.

Mallard (*Anas platyrhynchos*). Rare migrant. Individuals or pairs were seen during the 1st half of June on many of the island's lakes.

Northern shoveler (*Anas clypeata*). Irregular migrant. Single individuals or pairs were seen throughout September, often at Webster Lake.

Northern pintail (*Anas acuta*). Common breeder. Species is commonly found throughout the breeding season on many of the island's lakes. As many as 74 were observed on Antone Lake on 25 August.

Eurasian green-winged teal (*Anas crecca crecca*). Common breeder. Species is commonly found throughout the season in small numbers on many of the island's lakes.

Common pochard (*Aythya ferina*). Irregular migrant. A single individual was seen on Antone Lake on 18 May.

Tufted duck (*Aythya fuligula*). Irregular migrant. A single individual was seen on 9 June on Weather Bureau Lake.

Greater scaup (*Aythya marila*). Common migrant. Seen in flocks fewer than 10 throughout the season on lakes such as Polovina and Weather Buerau.

King eider (*Somateria spectabilis*). Uncommon migrant. Individuals in breeding and non-breeding plumage were seen throughout the season offshore at NW Point and Tolstoi Point, in Salt Lagoon, and in the Town Harbor.

Harlequin duck (*Histrionicus histrionicus*). Abundant migrant. Commonly seen offshore in rafts ranging from 5 to 300 individuals.

White-winged scoter (*Melanitta fusca*). Uncommon migrant. Seen offshore throughout the first half of June.

Long-tailed duck (*Clangula hyemalis*). Common breeder. Seen often throughout the season on lakes of varying size.

Bufflehead (*Bucephala albeola*). Uncommon migrant. Few individuals seen in late May to early June on Salt Lagoon, Ice House Lake, and Big Polovina Lake.

Red-breasted merganser (*Mergus serrator*). Rare migrant. An individual was seen on 5 June in Salt Lagoon, and two individuals were seen on Antone Lake on 10 June.

Sandhill crane (*Grus canadensis*). Irregular migrant. Single individuals were regularly sighted from late June through late August.

Pacific golden-plover (*Pluvialis fulva*). Abundant migrant. Starting in late July, small groups were commonly seen in the tundra above SW point up to the saddle of the High Bluffs trail.

Semipalmated plover (*Charadrius semipalmatus*). Common resident breeder. Seen throughout the season on Salt Lagoon behind Staff Quarters and at Pump House Lake.

Whimbrel (*Numenius phaeopus*). Uncommon migrant. A single individual was seen multiple times from 26 May to 10 June.

Bar-tailed godwit (*Limosa lapponica*). Uncommon migrant. A single individual was observed near the road at the Big Zapadni seal rookery on 23 May.

Ruddy turnstone (*Arenaria interpres*). Common migrant. This species is seen in abundance across the island foraging primarily along the coast or roosting on gravel roads. Migrants increase in mid-July with as many as 300 seen in a day.

Red knot (*Calidris canutus*). Accidental vagrant. Up to three individuals were sighted on the island between mid-August and early September.

Ruff (*Calidris pugnax*). Rare migrant. Single birds were sighted in mid-August through the end of the season at Pump House Lake and Tonki wetlands

Sharp-tailed sandpiper (*Calidris acuminata*). Common migrant. From the beginning of August through the end of the season, individuals were commonly found around Pump House Lake, Tonki Wetlands, and Barabaras Pond, with as many as 15 seen in a single day.

Red-necked stint (*Calidris ruficollis*). Irregular migrant. Single individuals were seen sporadically throughout the season in various wetlands, mixed with rock sandpipers.

Dunlin (*Calidris alpina*). Casual migrant. A single individual was seen with a mixed shorebird flock on Salt Lagoon on 27 August.

Pribilof rock sandpiper (*Calidris ptilocnemis ptilocnemis*). Abundant breeder. This species was seen daily across the island in a variety of habitats.

Buff-breasted sandpiper (*Calidris subruficollis*). Rare migrant. A single individual was seen in the tundra above SW Point on 20 August.

Pectoral sandpiper (*Calidris melanotos*). Common migrant. Single individuals seen throughout the month of June at small ponds and wetlands. Groups of up to 10 seen from 15 August until departure from the island.

Western sandpiper (*Calidris mauri*). Irregular migrant. Single individuals were observed in early June and groups of fewer than 10 individuals were observed from mid-August to early September.

Long-billed dowitcher (*Limnodromus scolopaceus*). Common migrant. Starting mid-August, this species was seen routinely at small ponds and wetlands, with a high count of eight individuals occurring on 26 August at Pump House Lake.

Gray-tailed tattler (*Tringa brevipes*). Uncommon migrant. Single individuals were seen in late May, and late August along rocky shorelines around the island.

Wandering tattler (*Heteroscelus incanus*). Common migrant. Commonly seen in small numbers throughout field season along rocky shorelines around the island, as well as in Salt Lagoon.

Marsh sandpiper (*Tringa stagnatilis*). Irregular migrant. One bird was seen at Pump House Lake or Saucer Pond for a period of two weeks starting 28 May.

Wood sandpiper (*Tringa glareola*). Rare migrant. Individuals were commonly seen at Pump House Lake and Tonki Wetlands from July through our departure in September.

Red-necked phalarope (*Phalaropus lobatus*). Common resident breeder. Commonly seen on small lakes such as Pump House, Saucer, and Weather Bureau. Seen offshore as well.

Red phalarope (*Phalaropus fulicaria*). Common resident non-breeder. Commonly seen as single individuals throughout the month of June on lakes such as Pump House, Saucer and Weather Bureau, with numbers growing starting in early August. A flock of 140 seen on Salt Lagoon on 2 August.

Parasitic jaeger (*Stercorarius parasiticus*). Uncommon migrant. Sighted sporadically offshore from Ridgewall and High Bluffs during the month of June.

Common murre (*Uria aalge*). Abundant breeder. Breeds on many cliffs around the island and can be seen daily. This species experienced near complete reproductive failure in 2017.

Thick-billed murre (*Uria lomvia*). Abundant breeder. This species breeds on the cliffs of the island and can be seen daily. Breeding success for this species in 2017 was the lowest on record.

Pigeon guillemot (*Cephus columba*). Rare resident non-breeder. Single individuals seen off Tourist Point and SW Point during July.

Ancient murrelet (*Sythliboramphus antiquus*). Rare resident non-breeder. Single individuals were seen offshore from SW point, Ridgewall and High Bluffs during the month of June.

Parakeet auklet (*Aethia psittacula*). Abundant breeder. The most common auklet on St. Paul, this species was seen daily on the cliffs until late July with very few individuals sighted throughout August and September, presumably due to nesting failure.

Least auklet (*Aethia pusilla*). Abundant breeder. This species was seen daily along the coast until July 18. They breed in moderate numbers in the rocky beaches of Reef, Tolstoi, and Zapadni, and in lower numbers at Lincoln Bight. In 2017 island-wide abundance of least auklets plummeted around the 3rd week of July, with very few individuals sighted throughout August, presumably due to nesting failure.

Crested auklet (*Aethia cristatella*). Common breeder. This species is not as abundant as least and parakeet auklets, yet with effort can be seen daily along the cliffs, especially at Zapadni and Reef. The most individuals seen this season was a raft of 34 on 8 June off of Tolstoi.

Horned puffin (*Fratercula corniculata*). Abundant breeder. This species was seen daily starting the last week of May on nearshore and offshore waters and on the cliffs where they breed. No individuals were seen this season carrying prey items.

Tufted puffin (*Fratercula cirrhata*). Abundant breeder. This species was seen daily on nearshore and offshore waters of the island starting the last week of May. They typically breed in rocky crevasses on the cliffs rather than in earthen burrows. No individuals were seen this season carrying prey items.

Black-legged kittiwake (*Rissa tridactyla*). Abundant breeder. This species breeds on cliffs around the island and can be seen daily on many of the lakes of the island. In 2017 this species experienced complete breeding failure, which was the 4th time since 1984 that failure occurred.

Red-legged kittiwake (*Rissa brevirostris*). Abundant breeder. Observations of this species were similar to black-legged kittiwakes this year. For the 3rd year in a row this species has failed to breed successfully on St. Paul. Most red-legged kittiwakes are found on the lower reaches of the High Bluff Cliffs opposite Rush Hill.

Glaucous-winged gull (*Larus glaucescens*). Abundant non-resident breeder. This species can be seen daily on the island. Throughout June, daily counts averaged 40 individuals, whereas starting in late July as many as 200 individuals could be seen daily on the island.

Glaucous gull (*Larus hyperboreus*). Rare migrant. Regularly sighted during May and June, and again in late August.

Common tern (*Sterna hirundo longipennis*). Rare migrant. Single individual seen flying around Antone Lake.

Red-throated loon (*Gavia stellata*). Rare migrant. Single individuals were seen throughout late May and early June on Salt Lagoon or offshore at Marunick on the north coast.

Yellow-billed loon (*Gavia adamsii*). Rare migrant. One bird was observed during the second week of July in Ice Lagoon.

Northern fulmar (*Fulmarus glacialis*). Abundant breeder. Common breeder found nesting and soaring along the rocky coastlines of the island. The first chick was seen on 22 July at Zapadni, though many nests were abandoned throughout the breeding season. At least 50 fulmar carcasses were found washed ashore starting on 3 August, primarily dark morphs.

Short-tailed shearwater (*Puffinus tenuirostris*). Common migrant. Regularly seen offshore, particularly off Southwest Point.

Double-crested cormorant (*Phalacrocorax auritus*). Irregular resident non-breeder. A single individual was seen five times at the Water Towers cormorant colony in June.

Red-faced cormorant (*Phalacrocorax urile*). Abundant breeder. This species breeds on the southern and western cliffs of the island and can be found roosting around the island wherever there is a rocky coastline. Nesting effort coalesced along the coastline below the water towers in the village this year, with 150 nests counted, which is the highest nesting density observed in recent years.

Pelagic cormorant (*Phalacrocorax pelagicus*). Uncommon resident non-breeder. Individuals seen among red-faced cormorants at nesting sites and nearshore rock roosts.

Osprey (*Pandion haliaetus*). Accidental vagrant. A single bird was observed multiple times on the island during July.

Bald eagle (*Haliaeetus leucocephalus*). Casual resident non-breeder. Adults were seen regularly throughout the season at High Bluffs, Salt Lagoon, and Tolstoi. Interactions between eagles and ledge-nesting seabirds were frequently observed and at times severe in scope due to higher than average reproductive failure for most ledge-nesting species this season.

White-tailed eagle (*Haliaeetus albicilla*). An individual was seen starting on 22 May near Salt Lagoon and continued to be seen periodically during June, often at High Bluffs flushing ledgenesters from the cliffs.

Peregrine falcon (*Falco peregrinus tundrius*). Casual migrant. An individual was observed periodically during the middle of July.

Pacific wren (*Troglodytes pacifica*). Abundant breeder. Commonly found throughout rocky coast and grass/umbel plant habitats. Community members stated that this species was far less abundant in 2017 than it has been in the past.

Northern wheatear (*Oenanthe oenanthe*). Uncommon migrant. As many as 14 individuals were seen on gravel roads near the airport on 24 August.

Eastern yellow wagtail (*Motacilla tschutschensis*). Common migrant. Two individuals were seen on the shoreline of Pumphouse Lake on 25 August.

American pipit (*Anthus rubescens*). Common migrant. Single individuals or pairs were observed from 20 August until early September, along gravel roads.

Brambling (*Fringilla montifringilla*). Common migrant. As many as six individuals were observed near shipping containers in the village or out at NE Point during the last week of May.

Gray-crowned rosy finch (*Leucosticte tephrocotis umbrina*). Abundant breeder. Found across the island in nearly all habitats. The first fledgling was observed on 20 June.

Hawfinch (*Coccothraustes coccothraustes*). Irregular migrant. A single individual was seen in town on 14 June.

Lapland longspur (*Calcarius lapponicus*). Abundant breeder. This species is the most numerous passerine on the island and is seen daily in all habitats and areas of the island. The first fledgling was observed on 20 June. Large flocks of fledglings were often seen near the roads of the island in late July through August.

Snow bunting (*Plectrophenax nivalis*). Abundant breeder. This species was seen daily. Regular sightings were at the Antone Lake Seawall, rocky outcrops near Southwest Point, and Hutchinson Hill.

MAMMALS

Pribilof island shrew (*Sorex pribilofensis*). Two shrews were encountered this season, in early June at Tsamana Lake and in late August near Little Zapadni fur seal rookery.

Arctic fox (*Alopex lagopus*). Foxes were abundant this year with pups encountered daily along the Zapadni, Tolstoi and High Bluffs coastlines, as well as in town and near fur seal rookeries.

Northern fur seal (*Callorhinus ursinus*). Fur seals are abundant on St. Paul with large rookeries scattered along the coastline. National Marine Mammal Lab considers the species 'depleted' and preformed numerous research projects investigating survival and foraging loactions during the pup rearing period.

Steller sea lion (*Eumetopias jubatus*). Single individuals were observed at Zapadni and Southwest Point throughout the season. Over 30 individuals were counted on Sea Lion Rock on 18 July.

Harbor seal (*Phoca vitulina*). This species was routinely seen near Southwet Point, and the high count was 32 individuals. In addition, three dead pups were found in mid-June, two on the sandy NE coastline, and one on the sandy SE coastline.

Reindeer (*Rangifer tarandus*). Reindeer were encountered primarily at High Bluffs, west and north of Rush Hill. Evidence of grazing and trampling of vegetation along with soil disturbance was encountered from population plot 28 north to plot 12.

Orca (*Orcinus orca*). Three orcas were observed off SW Point on 20 July. A pair were also sighted within English Bay this season.

Table 89. Observations and breeding status of birds and selected mammals at St. Paul Island, Alaska. Data represent observations made during the monitoring season only (see dates at end of table) and may not include sightings made by other researchers or community members on the island. Information comes from annotated lists, which were not included in reports prior to 2003, although incidental observations of wildlife were undoubtedly made in 1975-2002. Dashes indicate species not recorded that year but may not necessarily indicate absence from the island during the time period (e.g., species not observed although present, or species not recorded although observed). Species observed only at Otter or Walrus islands and not St. Paul in a given year are noted as "Otter" and "Walrus", respectively.

Table 89 (continued). Observations and breeding status of birds and selected mammals at St. Paul Island, Alaska. Data represent observations made during the monitoring season only (see dates at end of table) and may not include sightings made by other researchers or community members on the island. Information comes from annotated lists, which were not included in reports prior to 2003, although incidental observations of wildlife were undoubtedly made in 1975-2002. Dashes indicate species not recorded that year but may not necessarily indicate absence from the island during the time period (e.g., species not observed although present, or species not recorded although observed). Species observed only at Otter or Walrus islands and not St. Paul in a given year are noted as "Otter" and "Walrus", respectively.

^bMammals not recorded (NR) in all years.

Table 90. First flowering dates of plants identified on St. Paul Island, Alaska. Data represent the day a fully-opened flower was first observed on the island each year. Dates may be poor indicators of actual phenology because observations of initial flowering events for uncommon or inconspicuous plants may be missed or depend on timing of field crew activities. Identifications are made by field personnel on-island and have not been confirmed by other authorities. No data were collected in 2010; data may potentially exist before 2000 and in 2002–2006 but have not yet been summarized.

Table 90 (continued). First flowering dates of plants identified on St. Paul Island, Alaska. Data represent the day a fully-opened flower was first observed on the island each year. Dates may be poor indicators of actual phenology because observations of initial flowering events for uncommon or inconspicuous plants may be missed or depend on timing of field crew activities. Identifications are made by field personnel on-island and have not been confirmed by other authorities. No data were collected in 2010; data may potentially exist before 2000 and in 2002-2006 but have not yet been summarized.

Appendix A. Discrepancies in historic dataset of red-faced cormorant breeding chronology at St. Paul Island, Alaska.

Year	Details
1976	Mean hatch date reported comes from original data (Hunt et al. 1981), which differ from that reported in later refuge reports (Thomson and Sapora 2007, Thomson and Spitzer 2008, McClintock et al. 2010).
1978	Mean hatch date reported comes from original data (Hunt et al. 1981), which differ from that reported in later refuge reports (Thomson and Sapora 2007, Thomson and Spitzer 2008, McClintock et al. 2010).
1986	Mean hatch date reported comes from original data (Byrd 1986), which differ from that reported in later refuge reports (Thomson and Sapora 2007, Thomson and Spitzer 2008, McClintock et al. 2010).
1987	Mean hatch date reported comes from recalculation of raw data, which differ from that reported in earlier refuge reports (Thomson and Sapora 2007, Thomson and Spitzer 2008, McClintock et al. 2010), likely a Julian date calculation error.
1989	Standard deviation reported comes from recalculation of raw data, which differ from that reported in earlier refuge reports (Thomson and Sapora 2007, Thomson and Spitzer 2008, McClintock et al. 2010), likely a mathematical or transcription error.
1996	Mean hatch date and sample size come from recalculation of raw data, which differ from that reported in earlier refuge reports (Thomson and Sapora 2007, Thomson and Spitzer 2008, McClintock et al. 2010), likely a Julian date calculation, mathematical or transcription error.
1998	Mean hatch date reported comes from recalculation of raw data, which differ from that reported in earlier refuge reports (Thomson and Sapora 2007, Thomson and Spitzer 2008, McClintock et al. 2010), likely a Julian date calculation error.
2001	Standard deviation reported comes from recalculation of raw data, which differ from that reported in earlier refuge reports (Thomson and Sapora 2007, Thomson and Spitzer 2008, McClintock et al. 2010), likely a mathematical or transcription error.
2004	Mean hatch date, standard deviation, and sample size come from recalculation of raw data, which differ from that reported in earlier refuge reports (Thomson and Sapora 2007, Thomson and Spitzer 2008, McClintock et al. 2010), likely a Julian date calculation, mathematical or transcription error.
2006	Mean hatch date, standard deviation, and sample size come from recalculation of raw data, which differ from that reported in earlier refuge reports (Thomson and Sapora 2007, Thomson and Spitzer 2008, McClintock et al. 2010), likely a Julian date calculation, mathematical or transcription error.
2008	Standard deviation reported comes from recalculation of raw data, which differ from that reported in earlier refuge reports (Thomson and Spitzer 2008, McClintock et al. 2010), likely a mathematical or transcription error.
2009	Standard deviation reported comes from recalculation of raw data, which differ from that reported in earlier refuge reports (McClintock et al. 2010), likely a mathematical or transcription error.
2010	All data reported comes from recalculation of raw data.

Appendix B. Details of historic dataset of black-legged kittiwake reproductive performance at St. Paul Island, Alaska.

Year	Details
Data summary from original reports; data not resummarized by database because raw nest site data unavailable	
1975	Values reported here come from more recent Hunt et al. 1981 (which differ from values in Hunt et al. 1977, 1978) Mean clutch size (C/B) based on smaller-than-reported sample size Hatching success (E/C) value is midpoint of range (0.60-0.82) presented in original source (Hunt et al. 1981) Chick success (G/E) value is midpoint of range (0.41-0.64) presented in original source (Hunt et al. 1981) Reproductive success (F/B) calculated from known-clutch-size nests only Productivity (F/A) assumed to be same as fledglings/nest start (G/A) because no nests fledged >1 chick (Climo 1993)
1976	Values reported here come from more recent Hunt et al. 1981 (which differ from values in Hunt et al. 1977, 1978) Mean clutch size (C/B) based on smaller-than-reported sample size Hatching success (E/C) value is midpoint of range (0.72-0.88) presented in original source (Hunt et al. 1981) Chick success (G/E) value is midpoint of range (0.57-0.69) presented in original source (Hunt et al. 1981) Reproductive success (F/B) calculated from known-clutch-size nests only
1977	Values reported here come from more recent Hunt et al. 1981 (which differ from values in Hunt et al. 1978) Mean clutch size (C/B) based on smaller-than-reported sample size Hatching success (E/C) value is midpoint of range (0.59-0.85) presented in original source (Hunt et al. 1981) Chick success (G/E) value is midpoint of range (0.52-0.74) presented in original source (Hunt et al. 1981) Reproductive success (F/B) calculated from known-clutch-size nests only
1978	Mean clutch size (C/B) based on smaller-than-reported sample size Hatching success (E/C) value is midpoint of range (0.74-0.84) presented in original source (Hunt et al. 1981) Chick success (G/E) value is midpoint of range (0.58-0.66) presented in original source (Hunt et al. 1981) Reproductive success (F/B) calculated from known-clutch-size nests only
1979	Total nest sites (A) estimated from ratio of known-clutch nests/total nests 1975-1978 (Hunt et al. 1981) Mean clutch size (C/B) based on smaller-than-reported sample size Hatching success (E/C) value is midpoint of range (0.73-0.88) presented in original source (Hunt et al. 1981) Chick success (G/E) value is midpoint of range (0.50-0.60) presented in original source (Hunt et al. 1981) Reproductive success (F/B) calculated from known-clutch-size nests only
1993	Data based on short-term observations
1994	Data based on short-term observations
1995	Data based on short-term observations
Data summary from original reports for now; data not resummarized by database because raw nest site data currently incomplete (missing data from plots 80-93, needs to be found and entered)	
1986	Values reported in successive reports vary; values reported here come from most recent reliable island reports (e.g., Climo 1993, Thomson and Sapora 2007, Thomson and Spitler 2008)
1987	Values reported in successive reports vary; values reported here come from most recent reliable island reports (e.g., Climo 1993, Thomson and Sapora 2007, Thomson and Spitler 2008)
1988	Values from original source (Dragoo et al. 1989)
Data summary from database (summary of original raw nest site data)	
1984-1985, 1989-1992; 1996-current	

Appendix C. Details of historic dataset of red-legged kittiwake reproductive performance at St. Paul Island, Alaska.

Year	Details
Data summary from original reports; data not resummarized by database because raw nest site data unavailable	
1975	Values reported here come from more recent Hunt et al. 1981 (which differ from values in Hunt et al. 1977, 1978) Hatching success (E/C) value is midpoint of range (0.78-0.91) presented in original source (Hunt et al. 1981) Chick success (G/E) value is midpoint of range (0.81-0.94) presented in original source (Hunt et al. 1981)
1976	Values reported here come from more recent Hunt et al. 1981 (which differ from values in Hunt et al. 1977, 1978) Hatching success (E/C) value is midpoint of range (0.88-0.93) presented in original source (Hunt et al. 1981) Chick success (G/E) value is midpoint of range (0.92-0.98) presented in original source (Hunt et al. 1981)
1977	Values reported here come from more recent Hunt et al. 1981 (which differ from values in Hunt et al. 1978) Hatching success (E/C) value is midpoint of range (0.82-0.91) presented in original source (Hunt et al. 1981) Chick success (G/E) value is midpoint of range (0.81-0.89) presented in original source (Hunt et al. 1981)
1978	Hatching success (E/C) value is midpoint of range (0.54-0.71) presented in original source (Hunt et al. 1981) Chick success (G/E) value is a midpoint of range (0.65-0.85) presented in original source (Hunt et al. 1981)
1979	Hatching success (E/C) value is midpoint of range (0.63-0.71) presented in original source (Hunt et al. 1981) Chick success (G/E) value is midpoint of range (0.76-0.81) presented in original source (Hunt et al. 1981) Reproductive success (F/B) calculated from known-clutch-size nests only
1984	Original data presented as a range including nests of unknown fate and multiple ways of calculating success parameters (Johnson and Baker 1985) Values reported here were recalculated (B. Drummond, March 2010) from original report values but using only known-fate nests and not including chicks seen only at end of season
1993	Data based on short-term observations
1994	Data based on short-term observations
1995	Data based on short-term observations
Data summary from original reports for now; data not resummarized by database because raw nest site data currently incomplete (missing data from plots 80-93, needs to be found and entered)	
1986	Values reported in successive reports vary; values reported here come from most recent reliable island reports (e.g., Climo 1993, Thomson and Sapora 2007, Thomson and Spitler 2008)
1987	Values reported in successive reports vary; values reported here come from most recent reliable island reports (e.g., Climo 1993, Thomson and Sapora 2007, Thomson and Spitler 2008) from original source (Byrd 1987)
1988	Values from original source (Dragoo et al. 1989)
Data summary from database (summary of original raw nest site data)	
1985, 1989-1992; 1996-current	

Appendix D. Details of historic dataset of common murre reproductive performance at St. Paul Island, Alaska.

Year	Details
Data summary from original reports; data not resummarized by database because raw nest site data unavailable	
1975	No data to use (all nests monitored were high-disturbance sites; Hunt et al. 1981)
1976	Values reported include only minimal-disturbance sites (Hunt et al. 1981)
1977	No data to use (all nests monitored were high-disturbance sites; Hunt et al. 1981)
1978	Values reported include only minimal-disturbance sites (Hunt et al. 1981)
Data summary from original reports for now; data not resummarized by database because raw nest site data currently incomplete (missing data from plots 80-93, needs to be found and entered)	
1986	Values reported in successive reports vary; values reported here come from most recent reliable island reports (e.g., Climo 1993, Thomson and Sapora 2007, Thomson and Spitler 2008)
1987	Values reported in successive reports vary; values reported here come from most recent reliable island reports (e.g., Climo 1993, Thomson and Sapora 2007, Thomson and Spitler 2008) from original source (Byrd 1987)
1988	Values from original source (Dragoo et al. 1989)
Data summary from database (summary of original raw nest site data)	
1985, 1989-current	

Appendix E. Details of historic dataset of thick-billed murre reproductive performance at St. Paul Island, Alaska.

Year	Details
Data summary from original reports; data not resummarized by database because raw nest site data unavailable	
1975	No data to use (all nests monitored were high-disturbance sites; Hunt et al. 1981)
1976	Values reported include only minimal-disturbance sites (Hunt et al. 1981)
1977	Values reported include only minimal-disturbance sites (Hunt et al. 1981) Values reported here come from more recent Hunt et al. 1981 (which differ from values in Hunt et al. 1978) Nesting success (D/B) value is midpoint of range (0.66-0.84) presented in original source (Hunt et al. 1981) Fledgling success (F/B) value is midpoint of range (0.42-0.84) presented in original source (Hunt et al. 1981) Reproductive success (F/B) value is midpoint of range (0.35-0.62) presented in original source (Hunt et al. 1981)
1978	Nesting success (D/B) value is midpoint of range (0.74-0.79) presented in original source (Hunt et al. 1981) Fledgling success (F/B) value is midpoint of range (0.077-0.91) presented in original source (Hunt et al. 1981) Reproductive success (F/B) value is midpoint of range (0.61-0.68) presented in original source (Hunt et al. 1981)
Data summary from original reports for now; data not resummarized by database because raw nest site data currently incomplete (missing data from plots 80-93, needs to be found and entered)

1987	Values reported in successive reports vary; values reported here come from most recent reliable island reports (e.g., Climo 1993, Thomson and Sapora 2007, Thomson and Spitler 2008) from original source (Byrd 1987)
1988	Values from original source (Dragoo et al. 1989)
Data summary from database (summary of original raw nest site data)	
1984-1985, 1989-current	

Appendix F. Adult black-legged kittiwakes banded with alphanumeric color bands or three color band combinations outside of survival plots at St. Paul Island, Alaska. Birds were banded as part of the BSIERP project (2008-2010) and are not included in any resight efforts for survival data; this list simply provides a record of these individuals. Color codes are recorded as color and # of band for birds banded with alphanumeric color bands, and as colors (in code) of bands on left (L) and right (R) legs for birds banded with three band combinations.

color combo codes:		DG = dark green	O = orange	
Color band		Metal band #	Year banded	Location banded
Color or L leg	Band # or R leg			
DG/O	R	0974-09376	2008	Ridgewall Beach
Yellow	A2	0974-09369	2009	Ridgewall Beach
Yellow	A3	0974-09374	2009	Ridgewall Beach
Yellow	C3	714-10309	2009	Tsamana South
Yellow	E4	714-10390	2010	Tsamana South
Yellow	E5	714-10314	2010	Tsamana South

Appendix G. Adult common murres banded with alphanumeric color bands or four color band combinations outside of survival plots at St. Paul Island, Alaska. Birds were banded as part of the BSIERP project (2008-2010) and are not included in any resight efforts for survival data; this list simply provides a record of these individuals. Color codes are recorded as color and # of band for birds banded with alphanumeric color bands, and as colors (in code) of bands on left (L) and right (R) legs for birds banded with four band combinations.

color combo codes:			DB = dark blue DG = dark green	R = red O = orange	W = white Y = yellow	GY = gray

Appendix I. Diet datasets in the AMNWR diet dataset from St. Paul Island, Alaska. Years in parentheses are pending analysis.

Species	Recipient	Diet type	Years	In 2017 annual report
Common murre	Adult	Stomach, Lavage	1975-1979, 1984, 1992-1995, 1997-2000, 2008	Y
Common murre	Chick	Bill load, Regurgitation, Stomach	1976-1979, 1984, 2008, 2010	Y
Thick-billed murre	Adult	Stomach, Lavage	1975-1979, 1984, 1988, 1992-1995, 1997-2000, 2008-2010	Y
Thick-billed murre	Chick	Bill load, Regurgitation	1976-1979, 1984, 1987-1988, 2000, 2008-2010	Y
Parakeet auklet	Adult	Stomach	1975-1978	N
Parakeet auklet	Chick	Regurgitation, Gular pouch	1976-1977, 1996, 2009	N
Least auklet	Adult	Stomach	1975-1978, 1984	N
Least auklet	Chick	Regurgitation, Gular pouch	1975-1978, 1984, 1986, 1989, 1996-1998, 2000-2001, 2003-2016, (2017)	Y
Crested auklet	Adult	Stomach	1975-1977	N
Crested auklet	Chick	Regurgitation, Gular pouch	1976-1977, 2009	N
Horned puffin	Adult	Stomach	1975-1979, 1984	N
Horned puffin	Chick	Bill load	1976-1979, 1984	N
Tufted puffin	Adult	Stomach	1975-1979	N
Tufted puffin	Chick	Bill load	1976, 1979	N
Black-legged kittiwake	Adult	Stomach	1975-1979, 1984, 1992-1995, 1997-2000	Y
Black-legged kittiwake	Chick	Regurgitation	1975-1979, 1984-1985, 1987-1988, 1997-1998, 2000, 2003, 2006, 2008-2014, 2016	Y
Black-legged kittiwake	Immature	Stomach	1984	Y
Black-legged kittiwake	Adult+chick	Lavage	2008-2009	Y
Red-legged kittiwake	Adult	Stomach	1975-1979, 1984, 1992, 1994, 1997	Y
Red-legged kittiwake	Chick	Regurgitation	1976-1977, 1979, 2006-2007, 2010	Y
Glaucous-winged gull	Adult	Stomach	1978	Y
Northern fulmar	Adult	Stomach	1978	N
Red-faced cormorant	Adult	Stomach, Regurgitation	1975-1979, 1993,	N
Red-faced cormorant	Chick	Regurgitation, Bolus	1975-1978, 1984, 1996, 1998, (2009-2017)	Y
Red-faced cormorant	Immature	Stomach	1975-1976	N
